

# Industrial Router Pro Series

## UR32

### User Guide

## Preface

Thanks for choosing Milesight UR32 industrial cellular router. The UR32 industrial cellular router delivers tenacious connection over network with full-featured design such as automated failover/failback, extended operating temperature, dual SIM cards, hardware watchdog, VPN, Fast Ethernet and beyond.

This guide describes how to configure and operate the UR32 industrial cellular router. You can refer to it for detailed functionality and router configuration.

## Readers

This guide is mainly intended for the following users:

- Network Planners
- On-site technical support and maintenance personnel
- Network administrators responsible for network configuration and maintenance

© 2011-2025 Xiamen Milesight IoT Co., Ltd.

**All rights reserved.**

All information in this user guide is protected by copyright law. Whereby, no organization or individual shall copy or reproduce the whole or part of this user guide by any means without written authorization from Xiamen Milesight IoT Co., Ltd.

## Safety Precautions

Milesight will not shoulder responsibility for any loss or damage resulting from not following the instructions of this operating guide.

- ❖ The device must not be disassembled or remodeled in any way.
- ❖ To avoid risk of fire and electric shock, do keep the product away from rain and moisture before installation.
- ❖ Do not place the device where the temperature or humidity is below/above the operating range.
- ❖ The device must never be subjected to drops, shocks or impacts.
- ❖ Make sure the device is firmly fixed when installing.
- ❖ Make sure the plug is firmly inserted into the power socket.
- ❖ Do not pull the antenna or power supply cable, detach them by holding the connectors.

## Declaration of Conformity

UR32 is in conformity with the essential requirements and other relevant provisions of the CE, FCC, and RoHS.

For assistance, please contact

## Revision History

Date	Doc Version	Description
May. 16, 2019	V 1.1	Initial version
Nov. 14, 2019	V 1.2	Add Python, SMS, IP passthrough functions
May 11, 2020	V 1.3	Web interfaces upgrade
Dec. 9, 2020	V 2.0	Layout replace
Sept. 17, 2021	V 2.1	1. Cellular and ping detection support IPv6 2. Add WAN connection type: DHCPv6 client, DS-Lite 3. Add DHCPv6 Server feature 4. Add IPv6 static routing feature 5. Add Expert Option box in IPsec settings 6. Support SMS inbox and outbox record clear
June 30, 2023	V 2.2	1. Add high priority link revert feature; 2. Add MQTT and TR069 feature; 3. Support customized cellular MTU and IMS; 4. Support to import openVPN file configurations, add tls-crypt mode and authentication mode; 5. Update Modbus Master/Slave to Modbus Client/Server; 6. Support to configure L2TP hostname.
July 5, 2024	V 2.3	1. Add Wireguard VPN feature; 2. Add cellular band selection and subnet mask customization; 3. Support to sync time with cellular operator; 4. Support to show Ethernet port connection status and configure PoE settings; 5. Support MQTT feature on DI and serial DTU mode downlink; 6. Update default secondary ICMP and DNS server

		<p>address;</p> <p>7. Add WPA/WPA2-Enterprise encryption mode of WLAN client mode;</p> <p>8. IPsec setting web GUI optimization.</p>
April 11, 2025	V 2.4	<p>1. Add ZeroTier VPN.</p> <p>2. Compatible with DeviceHub 2.0 and Milesight Development Platform.</p> <p>3. Support 802.1x protocol to connect to Radius servers.</p> <p>4. Add cellular custom DNS server option.</p> <p>5. Optimize the configuration modes of Email groups and phone groups.</p> <p>6. Support to configure username, test email address in SMTP client settings.</p> <p>7. Add byte order on Modbus channel settings.</p>

## Chapter 1 Product Introduction

### 1.1 Overview

UR32 is an industrial cellular router with embedded intelligent software features that are designed for multifarious M2M/IoT applications. Supporting global WCDMA and 4G LTE, UR32 provides drop-in connectivity for operators and makes a giant leap in maximizing uptime.

Adopting high-performance and low-power consumption industrial grade CPU and wireless module, the UR32 is capable of providing wire-speed network with low power consumption and ultra-small package to ensure the extremely safe and reliable connection to the wireless network.

Meanwhile, the UR32 also supports Fast Ethernet ports, serial port (RS232/RS485) and I/O (input/output), which enables you to scale up M2M application combining data and video in limited time and budget.

UR32 is particularly ideal for smart grid, digital media installations, industrial automation, telemetry equipment, medical device, digital factory, finance, payment device, environment protection, water conservancy and so on.

For details of hardware and installation, please check UR32 Quick Start Guide.

### 1.2 Advantages

#### Benefits

- Built-in industrial strong NXP CPU, big memory
- Fast Ethernet for fast data transmission
- Dual SIM cards for backup between multiple carriers networking and global 2G/3G/LTE options make it easy to get connected
- Equipped with Ethernet, I/O, serial port, Wi-Fi, GPS for connecting diverse field assets
- Embedded Python SDK for second development
- Rugged enclosure, optimized for DIN rail or shelf mounting
- 3-year warranty included

#### Security & Reliability

- Automated failover/failback between Ethernet and Cellular (dual SIM)
- Enable unit with security frameworks like IPsec/OpenVPN/GRE/L2TP/PPTP/DMVPN/WireGuard/ZeroTier VPN
- Embed hardware watchdog, automatically recovering from various failure, and ensuring highest level of availability
- Establish a secured mechanism on centralized authentication and authorization of device access by supporting AAA (TACACS+, Radius, LDAP, local authentication) and multiple levels of user authority

## Easy Maintenance

- Milesight DeviceHub/Development Platform provide easy setup, mass configuration, and centralized management of remote devices
- The user-friendly web interface design and more than one option of upgrade help administrator to manage the device as easy as pie
- Web GUI and CLI enable the admin to achieve simple management and quick configuration among a large quantity of devices
- Efficiently manage the remote routers on the existing platform through the industrial standard SNMP and TR069

## Capabilities

- Link remote devices in an environment where communication technologies are constantly changing
- Industrial 32-bit ARM Cortex-A7 processor, high-performance operating up to 528MHz and 128 MB memory available to support more applications
- Support rich protocols like SNMP, TR069, MQTT, Modbus bridging, RIP, OSPF, etc
- Support wide operating temperature ranging from -40°C to 70°C/-40°F to 158°F

## Chapter 2 Access to Web GUI

This chapter explains how to access to Web GUI of the UR32 router. Connect PC to LAN port of UR32 router directly. The following steps are based on Windows 10 operating system for your reference.

Username: **admin**

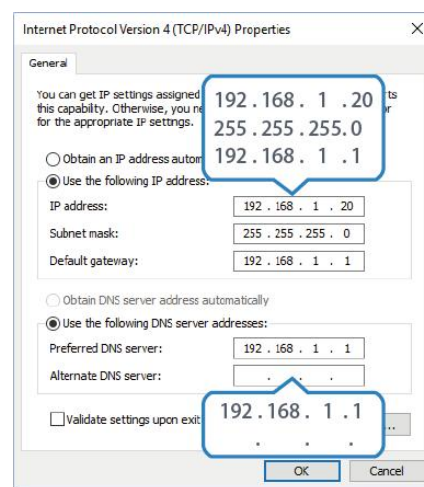

Password: **password**

IP Address: **192.168.1.1**

1. Go to “Control Panel” → “Network and Internet” → “Network and Sharing Center”, then click “Ethernet” (May have different names).

2. Go to “Properties” → “Internet Protocol Version 4(TCP/IPv4)”, select “Obtain an IP address automatically” or “Use the following IP address”, then assign a static IP manually within the same subnet of the device.

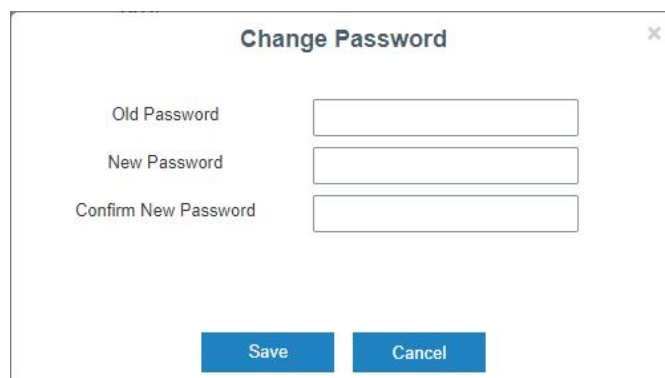

3. Open a Web browser on your PC (Chrome is recommended), type in the IP address 192.168.1.1, and press Enter on your keyboard.

4. Enter the username, password, and click "Login".

- !** If you enter the username or password incorrectly more than 5 times, the login page will be locked for 10 minutes.

5. When you login with the default username and password, you will be asked to modify the password. It's suggested that you change the password for the sake of security. Click "Cancel" button if you want to modify it later.

The image shows a "Change Password" dialog box. It has a title bar with the text "Change Password" and a close button (X). Inside the dialog, there are three input fields labeled "Old Password", "New Password", and "Confirm New Password". At the bottom of the dialog, there are two buttons: "Save" and "Cancel".

6. After you login the Web GUI, you can view system information and perform configuration on the router.

## Chapter 3 Web Configuration

### 3.1 Status

#### 3.1.1 Overview

You can view the system information of the router on this page.

System Information		System Status	
Model	UR32-L00E-G-W-485	Local Time	2023-06-30 19:21:33 Friday
Serial Number	621892434471	Uptime	15days, 04:18:43
Firmware Version	32.3.0.7	CPU Load	52%
Hardware Version	V1.1	CPU Temperature	66°C
		RAM (Available/Capacity)	24MB/128MB(18.75%)
		Flash (Available/Capacity)	81MB/128MB(63.28%)
		SD Card(Available/Capacity)	Not Inserted
Cellular		WAN <span>● Link in use</span>	
Status	No SIM Card	Status	Online

System Information	
Item	Description
Model	Show the model name of router.
Serial Number	Show the serial number of router.
Firmware Version	Show the currently firmware version of router.
Hardware Version	Show the currently hardware version of router.

Table 3-1-1-1 System Information

System Status	
Item	Description
Local Time	Show the currently local time of system.
Uptime	Show the information on how long the router has been running.
CPU Load	Show the current CPU utilization of the router.
CPU Temperature	Show current CPU temperature.
RAM (Available/Capacity)	Show the RAM capacity and the available RAM memory.
Flash (Available/Capacity)	Show the Flash capacity and the available Flash memory.
SD Card (Available/Capacity)	Show the capacity and the available memory of micro SD card if it is inserted.

Table 3-1-1-2 System Status

Cellular	
Item	Description
Status	Show the real-time status of the currently SIM card
Current SIM	Show the SIM card currently used for the data connection.

IPv4/IPv6	Show the IPv4/IPv6 address obtained from the mobile carrier.
Connection Duration	Show the connection duration of the currently SIM card.
Data Usage Monthly	Show the monthly data usage statistics of currently used SIM card.

Table 3-1-1-3 Cellular Status

WAN	
Item	Description
Status	Show the currently status of WAN port.
IPv4/IPv6	The IPv4/IPv6 address configured WAN port.
MAC	The MAC address of the Ethernet port.
Connection Duration	Show the connection duration of the WAN port.

Table 3-1-1-4 WAN Status

WLAN (Only applicable for Wi-Fi model)	
Item	Description
Status	Show the currently status of WLAN.
IP	Show the WLAN mode (AP or client).
SSID	Show the SSID of the WLAN AP or client.
Connected Clients	Show the amount of connected devices when mode is AP.

Table 3-1-1-5 WLAN Status

LAN	
Item	Description
IP4/IPv6	Show the IP4/IPv6 address of the LAN port.
Connected Devices	Number of devices that connected to the router's LAN.

Cell ID	3d98485		

Figure 3-1-2-1

#### Modem Information

Item	Description
Status	Show corresponding detection status of module and SIM card.
Version	Show the cellular module firmware version.
Current SIM	Show the current SIM card used.
Signal Level	Show the cellular signal level.
Register Status	Show the registration status of SIM card.
IMEI	Show the IMEI of the module.
IMSI	Show IMSI of the SIM card.
ICCID	Show ICCID of the SIM card.
ISP	Show the network provider which the SIM card registers on.
Network Type	Show the connected network type, such as LTE, 3G, etc.
PLMN ID	Show the current PLMN ID, including MCC, MNC, LAC and Cell ID.
LAC	Show the location area code of the SIM card.
Cell ID	Show the Cell ID of the SIM card location.

Table 3-1-2-1 Modem Information

Network	
Item	Description
Status	Show the connection status of cellular network.
IPv4/IPv6 Address	Show the IPv4/IPv6 address and netmask of cellular network.
IPv4/IPv6 Gateway	Show the IPv4/IPv6 gateway and netmask of cellular network.
IPv4/IPv6 DNS	Show the IPv4/IPv6 DNS of cellular network.
Connection Duration	Show information on how long the cellular network has been connected.

Table 3-1-2-2 Network Status

Data Usage Monthly	
Item	Description
SIM-1	Show the monthly data usage statistics of SIM-1.
SIM-2	Show the monthly data usage statistics of SIM-2.

Table 3-1-2-3 Data Usage Information

### 3.1.3 Network

On this page you can check the WAN and LAN status of the router.

WAN-IPv4						
Port	Status	Type	IPv4	Gateway	DNS	Connection Duration
LAN1/WAN	up	Static	192.168.22.210/24	192.168.22.1	114.114.114.114	08h 32m 53s
WAN-IPv6						
Port	Status	Type	IPv6	Gateway	DNS	Connection Duration
LAN1/WAN	up	Static	fe80::26e1:24ff:fe11:2fea/64	-	-	08h 32m 53s

Figure 3-1-3-1

WAN Status	
Item	Description

Port	Show the name of WAN port.
Status	Show the status of WAN port. "up" refers to a status that WAN is enabled and Ethernet cable is connected. "down" means Ethernet cable is disconnected or WAN function is disabled.
Type	Show the dial-up connection type of WAN port.
IPv4/IPv6	Show the IPv4 address with netmask or IPv6 address with prefix-length of WAN port.
Gateway	Show the gateway of WAN port.
DNS	Show the DNS of WAN port.
Connection Duration	Show the information on how long the Ethernet cable has been connected on WAN port when WAN function is enabled. Once WAN function is disabled or Ethernet connection is disconnected, the duration will stop.

Table 3-1-3-1 WAN Status

Bridge				
Name	STP	IPv4	IPv6	Members
Bridge0	Disabled	192.168.219.1/24	7878::1/64	vlan 1,WLAN

Figure 3-1-3-2

Bridge	
Item	Description
Name	Show the name of the bridge interface.
STP	Show if STP is enabled.
IPv4/IPv6	Show the IPv4/IPv6 address and netmask of the bridge interface.
Netmask	Show the Netmask of the bridge interface.
Members	Show the members of the bridge interface.

Table 3-1-3-2 Bridge Status

### 3.1.4 WLAN (Only Applicable to Wi-Fi Version)

You can check Wi-Fi status on this page, including the information of access point and client.

WLAN Status					
Name	Status	Type	SSID	IP Address	Netmask
WLAN	Running	AP	Router_F02FEB	192.168.1.1	255.255.255.0

Associated Stations			
SSID	MAC Address	IP Address	Connection Duration

Figure 3-1-4-1

WLAN Status	
Item	Description

WLAN Status	
Name	Show the name of the Wi-Fi interface .
Status	Show the status of the Wi-Fi interface.
Type	Show the Wi-Fi interface type.
SSID	Show the SSID of the router when the interface type is AP. Show the SSID of AP which the router connected to when the interface type is Client.
IP Address	Show the IP address of the router when the interface type is AP. Show the IP address of AP which the router connected to when the interface type is Client.
Netmask	Show the netmask of the router when the interface type is AP. Show the netmask of AP which the router connected to when the interface type is Client.
Associated Stations	
SSID	Show the SSID of the router when the interface type is AP. Show the SSID of AP which the router connected to when the interface type is Client.
MAC Address	Show the MAC address of the client which connected to the router when the interface type is AP. Show the MAC address of the AP which the router connected to when the interface type is Client.
IP Address	Show the IP address of the client which connected to the router when the interface type is AP. Show the IP address of the AP which the router connected to when the interface type is Client.
Connection Duration	Show the connection duration between client device and router when the interface type is AP. Show the connection duration between router and the AP when the interface type is Client.

Item	Description
Status	Show the status of GPS.
Time for Locating	Show the time for locating.
Satellites In Use	Show the quantity of satellites in use.
Satellites In View	Show the quantity of satellites in view.
Latitude	Show the Latitude of the location.
Longitude	Show the Longitude of the location.
Altitude	Show the Altitude of the location.
Speed	Show the speed of movement.

Table 3-1-8-1 GPS Status Description

## 3.2 Network

### 3.2.1 Interface

#### 3.2.1.1 Link Failover

This section describes how to configure link failover strategies, their priority and the ping settings, each rule owns its own ping rules by default. Router will follow the priority to choose the next available interface to access the internet, make sure you have enable the full interface that you need to use here. If priority 1 can only use IPv4, UR32 will select a second link which IPv6 works as main IPv6 link and vice versa.

The screenshot shows the 'Link Failover' configuration page. At the top, there are tabs for 'Link Failover', 'Cellular', 'Port', 'WAN', 'Bridge', 'Switch', and 'Loopback'. The 'Link Priority' section contains a table with the following data:

Priority	Enable Rule	Link in use	Interface	Connection Type	IP	Operation
1	<input checked="" type="checkbox"/>		Cellular-SIM1	DHCP	10.53.62.91	
2	<input checked="" type="checkbox"/>		WAN	Static	192.168.40.151	
3	<input checked="" type="checkbox"/>		Cellular-SIM2	DHCP	-	

The 'Settings' section includes the following options:

- Revert to High Priority Link: ☒
- Revert Interval:  s
- Dual-card Switch Delay:  s
- Dual-card Recovery Interval:  min
- Emergency Reboot: ☐

Figure 3-2-1-1

Link Failover	
Item	Description
Link Priority	
Priority	Display the priority of each interface, you can modify it by the operation's up and down button.
Enable Rule	If enabled, the router will put this interface into its switching rule. For the Cellular interface, if it's not enabled here, the interface will be disabled as well.
Link In Use	Mark whether this interface is in use with Green color
Interface	Display the name of the interface.
Connection type	Display how to obtain the IP address in this interface, like static IP or DHCP.
IP	Display the IP address of the interface.
Operation	You can change the priority of the rules and configure the ping detection rules here.
Settings	
Revert to High Priority Link	When the connection of high priority link returns back, reverting back to high priority link.
Revert Interval	Specify the number of seconds to waiting for switching to the

	link with higher priority, 0 means disable the function.
Dual-card Switch Delay	The delay time to switch to low priority card when high priority cellular connection is failed. 0 means switching immediately.
Dual-card Recovery Interval	The interval to detect high priority cellular connection. If the connection is recover, switching back to high priority cellular link.
Emergency Reboot	Enable to reboot the device if no link is available.

Table 3-2-1-1 Link Failover Parameters

Figure 3-2-1-2

Ping Detection	
Item	Description
Enable	If enabled, the router will periodically detect the connection status of the link.
IPv4/IPv6 Primary Server	The router will send ICMP packet to the IPv4/IPv6 address or hostname to determine whether the Internet connection is still available or not.
IPv4/IPv6 Secondary Server	The router will try to ping the secondary server name if primary server is not available.
Interval	Time interval (in seconds) between two Pings.
Retry Interval	Set the ping retry interval. When ping failed, the router will ping again in every retry interval.
Timeout	The maximum amount of time the router will wait for a response to a ping request. If it does not receive a response for the amount of time defined in this field, the ping request will be considered to have failed.
Max Ping Retries	The retry times of the router sending ping request until determining that the connection has failed.

Table 3-2-1-2 Ping Detection Parameters

### 3.2.1.2 Cellular

This section explains how to set the related parameters for the cellular network. The UR32 cellular router has two cellular interfaces, namely SIM1 and SIM2. Only one cellular interface is active at one time. If both cellular interfaces are enabled, it will follow the priority rule configured in the Link Failover page.

	SIM1	SIM2
Protocol Type	IPv4	IPv4
APN		
Username		
Password		
PIN Code		
Access Number		
Authentication Type	None	None
Network Type	Auto	Auto

Customize MTU	<input type="checkbox"/>	<input type="checkbox"/>
MTU	1500	1500
Data Limit	0 MB	0 MB
Billing Day	Day 1 of The Month	Day 1 of The Month

Figure 3-2-1-3

Cellular Settings	
Item	Description
Protocol Type	Select from "IPv4", "IPv6" and "IPv4/IPv6".
APN	Enter the Access Point Name for the cellular dial-up connection provided by the local ISP.
Username	Enter the username for the cellular dial-up connection provided by the local ISP.
Password	Enter the password for the cellular dial-up connection provided by the

	local ISP.
PIN Code	Enter a 4-8 characters PIN code to unlock the SIM.
Access Number	Enter the dial-up center NO. For cellular dial-up connection provided by local ISP.
Authentication Type	Select from "None", "PAP", or "CHAP".
Network Type	Select from "Auto", "4G Only", "3G Only", and "2G Only". Auto: connect to the network with the strongest signal automatically. 4G Only: connect to 4G network only. And so on.
Cellular Frequency Band	Select the cellular bands used to register the cellular network. It can be used to optimize cellular speeds by selecting specific bands.
PPP Preferred	The PPP dial-up method is preferred.
IMS Enable	Enable or disable IMS function.
SMS Center	Enter the local SMS center number for storing, forwarding, converting and delivering SMS message.
Enable NAT	Enable or disable NAT function.
Roaming	Enable or disable roaming.
IPv4 Subnet Mask	Customize the cellular subnet mask. If blank, the device will use the subnet mask provided by the cellular base station.
IPv4 Primary DNS	IPv4 address of the preferred DNS server.
IPv4 Secondary DNS	IPv4 address of the secondary DNS server.
IPv6 Primary DNS	IPv6 address of the preferred DNS server.
IPv6 Secondary DNS	IPv6 address of the secondary DNS server.
Customize MTU	Enable or disable to customize the maximum transmission units. When disabled, the device will use the operator's MTU settings.
MTU	Customize the maximum transmission units.
Data Limit	When you reach the specified data usage limit, the data connection of the currently used SIM card will be disabled. 0 means disable the function.
Billing Day	Choose the billing day of the SIM card, the router will reset the data used to 0.

### 3.2.1.3 Port

This section describes how to configure the Ethernet port parameters.  
UR32 cellular router supports 2 Fast Ethernet ports.

**Port Setting**

Port	Connection Status	Status	Property	Speed	Duplex
LAN1/WAN	Connected	up	wan	auto	auto
LAN2	Connected	up	lan	auto	auto

Figure 3-2-1-5

Port Setting	
Item	Description
Port	Users can define the Ethernet ports according to their needs.
Connection Status	Show the connection status of this Ethernet port.
Status	Set the status of the Ethernet port; select "up" to enable and "down" to disable.
Property	Show the Ethernet port's type, as a WAN port or a LAN port.
Speed	Set the Ethernet port's speed. The options are "auto", "100 Mbps", and "10 Mbps".
Duplex	Set the Ethernet port's mode. The options are "auto", "full", and "half".

Table 3-2-1-5 Port Parameters

**Note:**

- Only the PoE version (model name included "-P") supports the below settings.
- These settings only work when this router is powered by 48V.
- Only the devices with hardware version 3.0 and later support these features.
- Only when the port property of LAN1/WAN is set to LAN port, the PoE setting will work.

**PoE**

Port	PoE	Power Supply	Voltage (V)	Current (mA)	Power (W)	Describe	PING detection IP	Operation
LAN1	Enable	Power On	47	79	3.745		1.2.3.4	  
LAN2	Enable	Power On	47	120	5.688		1.2.3.4	  

Figure 3-2-1-6

PoE Setting	
Item	Description
Port	Users can define the Ethernet ports according to their needs.
PoE	Enable or disable this Ethernet port to supply power.
Power Supply	Show the power supply status of this Ethernet port.
Voltage	Show the current output voltage of this Ethernet port.
Current	Show the current output current of this Ethernet port.
Power	Show the current output power of this Ethernet port.

Describe	Add the description of this Ethernet port.
Ping Detection IP	Show the IP address to send ICMP packet to detect the connection status.
Operation	You can change the power supply priority of the ports and configure the ping detection rules here.

Figure 3-2-1-7

Ping Detection reboot	
Item	Description
Enable	If enabled, the router will periodically detect the connection status of the port. If detection fails, the router will reboot this port.
Destination IP	The router will send an ICMP packet to the IPv4 address to determine whether the connection is still available or not.
Interval	Time interval (in seconds) between two Pings.
Ping Retry Interval	Set the ping retry interval. When ping fails, the router will ping again in every retry interval.
Overtime Period	The maximum amount of time the router will wait for a response to a ping request. If it does not receive a response for the amount of time defined in this field, the ping request will be considered to have failed.
Max Ping Retries	The retry times of the router sending ping request until determining that the connection has failed.
Reboot Interval	The power-off interval of this Ethernet port.
Max Reboot Times	The retry times of the router rebooting this port. 0 means no limits.

IPv4 Secondary DNS	223.5.5.5
Enable NAT	<input checked="" type="checkbox"/>

Figure 3-2-1-12

PPPoE	
Item	Description
Username	Enter the username provided by your Internet Service Provider (ISP).
Password	Enter the password provided by your Internet Service Provider (ISP).
Link Detection Interval (s)	Set the heartbeat interval for link detection. Range: 1-600.
Max Retries	Set the maximum retry times after it fails to dial up. Range: 0-9.
Use Peer DNS	Obtain peer DNS automatically during PPP dialing. DNS is necessary when visiting domain name.

Table 3-2-1-11 PPPoE Parameters

#### 4. Dual-Stack Lite

Dual-Stack Lite (DS-Lite) uses IPv4-in-IPv6 tunneling to send a subscriber's IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber's IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN-related processing. The response packets traverse through the same path to the subscriber.

Enable	<input checked="" type="checkbox"/>
Port	LAN1/WAN

Figure 3-2-1-15

WLAN	
Item	Description
Enable	Enable/disable WLAN.
Work Mode	Select router's work mode. The options are "Client" or "AP".
AP Mode	
BSSID	Show the MAC address of this WLAN interface.
Radio Type	Select Radio type. The options are "802.11b (2.4 GHz)", "802.11g (2.4 GHz)", "802.11n (2.4 GHz)".
Channel	Select wireless channel. The options are "Auto", "1", "2"....."11".
Bandwidth	Select bandwidth. The options are "20MHz" and "40MHz".
SSID	Fill in the SSID of the access point.
Encryption Mode	Select encryption mode. The options are "No Encryption", "WEP Open System", "WEP Shared Key", "WPA-PSK", "WPA2-PSK", "WPA-PSK/WPA2-PSK", "WPA-EAP" and "WPA2-EAP"..
Cipher	Select cipher of WPA encryption. The options are "Auto", "AES", "TKIP" and "AES/TKIP".
Key	Fill the key to connect to this access point. The default key is <b>iotpassword</b> .
Radius-Authentication-Server	Enter the IP address of the Radius authentication server.

Radius-Authentication-Port	Enter the Radius authentication server port number.
Radius-Authentication-Secret	Enter the shared key for the Radius Authentication Server.
Radius-Accounting-Server	Enter the IP address of the Radius accounting server.
Radius-Accounting-Port	Enter the port number of the Radius accounting server.
Radius-Accounting-Secret	Enter the shared key for the Radius accounting server.
NAS Identifier	Unique identifier, used to identify the access device, can help the RADIUS server distinguish authentication requests from different access devices.
SSID Broadcast	When SSID broadcast is disabled, other wireless devices can't find the SSID, and users have to enter the SSID manually to access to the wireless network.
AP Isolation	When AP isolation is enabled, all users who access to the AP are isolated without communication with each other.
Guest Mode	The internal network is not allowed to visit if the guest mode is enabled.
Max Client Number	Set the maximum number of clients to access when the router is configured as AP.
<b>MAC Filtering</b>	
Type	Choose the filter type of devices connected to this router's wireless access point. <b>Disable:</b> allow all users to connect to this access point. <b>Allow and Block the Rest:</b> Only the listed MAC addresses are allowed to connect to the router's wireless access point. <b>Block and allow the rest:</b> The listed MAC addresses are not allowed to connect to the router's wireless access point.
MAC Address	The device MAC addresses which need to block or allow.
Description	The description of this MAC address.
<b>Client Mode</b>	
Scan	Click to scan the access points around this device.
SSID	Fill in the SSID of the access point.
BSSID	Fill in the MAC address of the access point. Either SSID or BSSID can be filled to join the network.
Encryption Mode	Select encryption mode. The options are "No Encryption", "WEP Open System", "WEP Shared Key", "WPA-PSK", "WPA2-PSK", "WPA-PSK/WPA2-PSK", "WPA-Enterprise", "WPA2-Enterprise" and "WPA-Enterprise/WPA2-Enterprise".
Cipher	Select cipher of WPA encryption. The options are "Auto", "AES", "TKIP" and "AES/TKIP".
Key	Fill the key to connect to this access point.

Xsupplicant Type	Select from "Peap", "Leap", "TLS" and "TTLS".
Username	Fill the username of WPA/WPA2-Enterprise.
Password	Fill the password of WPA/WPA2-Enterprise.
Anonymous Identity	Fill the anonymous identity of WPA/WPA2-Enterprise.
Phase 1/2	Fill the phase of WPA/WPA2-Enterprise.
CA Certificate	The public server certificate used for verifying with WPA/WPA2-Enterprise access point.
Public Key	When Xsupplicant type is "TLS", import the public key used for verifying with WPA/WPA2-Enterprise access point.
Private Key	When Xsupplicant type is "TLS", import the private key used for verifying with WPA/WPA2-Enterprise access point.
Private Key Decryption	Set the decryption password of private key.
<b>IP Setting</b>	
Protocol	Set the protocol to get the WLAN IP address.
IP Address	Set the IP address in wireless network when protocol is Static IP.
Netmask	Set the netmask in wireless network when protocol is Static IP.
Gateway	Set the gateway in wireless network when protocol is Static IP.

[Wi-Fi Application Example](#)

### 3.2.1.7 Switch

VLAN is a kind of new data exchange technology that realizes virtual work groups by logically dividing

the LAN device into network segments.

The screenshot displays two configuration sections. The 'LAN Settings' section features a table with columns: Name, VLAN ID, IP Address, Netmask, MTU, and Operation. Below this is a '+ ' button. The 'VLAN Settings' section features a table with columns: VLAN ID, LAN 1, LAN 2, LAN 3, LAN 4, CPU, and Operation. The first row shows VLAN ID '1', LAN 1-4 set to 'Untagged', and CPU set to 'Tagged'. There are 'x' and '+' buttons for row management.

Figure 3-2-1-17

Switch	
Item	Description
<b>LAN Settings</b>	
Name	Set interface name of VLAN.
VLAN ID	Select VLAN ID of the interface.
IP Address	Set IP address of LAN port.
Netmask	Set Netmask of LAN port.
MTU	Set the maximum transmission unit of LAN port. Range: 68-1500.
<b>VLAN Settings</b>	
VLAN ID	Set the label ID of the VLAN. Range: 1-4094.
LAN 1/2/3/4	Make the VLAN bind with the corresponding ports and select status from "Tagged", "Untagged" and "Close" for Ethernet frame on trunk link.
CPU	Control communication between VLAN and other networks.

Table 3-2-1-16 VLAN Trunk Parameters

### 3.2.1.8 Loopback

Loopback interface is used for replacing router's ID as long as it is activated. When the interface is DOWN, the ID of the router has to be selected again which leads to long convergence time of OSPF. Therefore, Loopback interface is generally recommended as the ID of the router.

Loopback interface is a logic and virtual interface on router. Under default conditions, there's no loopback interface on router, but it can be created as required.

The screenshot shows the 'Loopback Address' section with input fields for IP Address (127.0.0.1) and Netmask (255.0.0.0). Below is the 'Multiple IP Addresses' section with a table for adding additional IP addresses and netmasks. A 'Save' button is located at the bottom left.

Figure 3-2-1-18

Loopback		
Item	Description	Default
IP Address	Unalterable	127.0.0.1
Netmask	Unalterable	255.0.0.0
Multiple IP Addresses	Apart from the IP above, user can configure other IP addresses.	Null

Table 3-2-1-17 Loopback Parameters

### 3.2.2 DHCP

DHCP adopts Client/Server communication mode. The Client sends configuration request to the Server which feeds back corresponding configuration information and distributes IP address to the Client so as to achieve the dynamic configuration of IP address and other information.

#### 3.2.2.1 DHCP Server/DHCPv6 Server

UR32 can be set as a DHCP server or DHCPv6 server to distribute IP address when a host logs on and ensures each host is supplied with different IP addresses. DHCP Server has simplified some previous network management tasks requiring manual operations to the largest extent. UR32 only supports stateful DHCPv6 when working as DHCPv6 server.

### 3.2.3 Firewall

This section describes how to set the firewall parameters, including security, ACL, DMZ, Port Mapping, MAC Binding and SPI.

The firewall implements corresponding control of data flow at entry direction (from Internet to local area network) and exit direction (from local area network to Internet) according to the content features of packets, such as protocol style, source/destination IP address, etc. It ensures that the router operate in a safe environment and host in local area network.

#### 3.2.3.1 Security

**Prevent Attack**

Website Blocking	
URL Blocking	Enter the HTTP address which you want to block.
Keyword Blocking	You can block specific website by entering keyword. The maximum number of character allowed is 64.

Table 3-2-3-1 Security Parameters

### 3.2.3.2 ACL

Access control list, also called ACL, implements permission or prohibition of access for specified network traffic (such as the source IP address) by configuring a series of matching rules so as to filter the network interface traffic. When router receives packet, the field will be analyzed according to the ACL rule applied to the current interface. After the special packet is identified, the permission or prohibition of corresponding packet will be implemented according to preset strategy.

The data package matching rules defined by ACL can also be used by other functions requiring flow distinction.

The screenshot shows the 'ACL' configuration page within a web interface. At the top, there are tabs for 'Security', 'ACL' (selected), 'Port Mapping', 'DMZ', 'MAC Binding', 'Custom Rules', and 'SPI'. Below the tabs, the 'ACL Setting' section includes a 'Default Filter Policy' dropdown menu set to 'Accept'. The 'Access Control List' section features a table with columns: ID, Action, Protocol, Source IP, Destination IP, More Detail, Description, and Operation. A blue '+' button is located at the bottom right of this table. The 'Interface List' section has a table with columns: Interface, In ACL, Out ACL, and Operation. A blue '+' button is also at the bottom right of this table. A 'Save' button is positioned at the bottom left of the interface.

Figure 3-2-3-3

Item	Description
<b>ACL Setting</b>	
Default Filter Policy	Select from "Accept" and "Deny". The packets which are not included in the access control list will be processed by the default filter policy.
<b>Access Control List</b>	
Type	Select type from "Extended" and "Standard".
ID	User-defined ACL number. Range: 1-199.
Action	Select from "Permit" and "Deny".
Protocol	Select protocol from "ip", "icmp", "tcp", "udp", and "1-255".
Source IP	Source network address (leaving it blank means all).
Source Wildcard Mask	Wildcard mask of the source network address.
Destination IP	Destination network address (0.0.0.0 means all).
Destination Wildcard Mask	Wildcard mask of destination address.
Description	Fill in a description for the groups with the same ID.
ICMP Type	Enter the type of ICMP packet. Range: 0-255.
ICMP Code	Enter the code of ICMP packet. Range: 0-255.
Source Port Type	Select source port type, such as specified port, port range, etc.
Source Port	Set source port number. Range: 1-65535.
Start Source Port	Set start source port number. Range: 1-65535.
End Source Port	Set end source port number. Range: 1-65535.
Destination Port Type	Select destination port type, such as specified port, port range, etc.

Destination Port	Set destination port number. Range: 1-65535.
Start Destination Port	Set start destination port number. Range: 1-65535.
End Destination Port	Set end destination port number. Range: 1-65535.
More Details	Show information of the port.
<b>Interface List</b>	
Interface	Select network interface for access control.
In ACL	Select a rule for incoming traffic from ACL ID.
Out ACL	Select a rule for outgoing traffic from ACL ID.

Table 3-2-3-2 ACL Parameters

### 3.2.3.3 Port Mapping (DNAT)

When external services are needed internally (for example, when a website is published externally), the external address initiates an active connection. And, the router or the gateway on the firewall receives the connection. Then it will convert the connection into an internal connection. This conversion is called DNAT, which is mainly used for external and internal services.

Source IP	Source Port	Destination IP	Destination Port	Protocol	Description	Operation
0.0.0.0/0				TCP		X
						+

Figure 3-2-3-3

Port Mapping	
Item	Description
Source IP	Specify the host or network which can access local IP address. 0.0.0.0/0 means all.
Source Port	Enter the TCP or UDP port from which incoming packets are forwarded. Range: 1-65535.
Destination IP	Enter the IP address that packets are forwarded to after being received on the incoming interface.
Destination Port	Enter the TCP or UDP port that packets are forwarded to after being received on the incoming port(s). Range: 1-65535.
Protocol	Select from "TCP" and "UDP" as your application required.
Description	The description of this rule.

Table 3-2-3-3 Port Mapping Parameters

### Related Configuration Example

[NAT Application Example](#)

### 3.2.3.4 DMZ

DMZ is a host within the internal network that has all ports exposed, except those forwarded ports in port mapping.

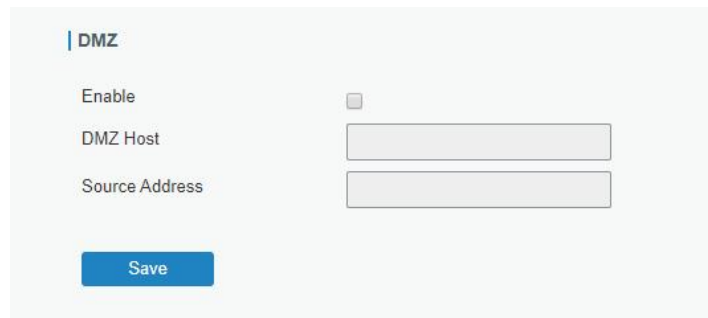

The image shows a web interface for configuring DMZ settings. It has a title 'DMZ' with a vertical bar to its left. Below the title, there are three labels: 'Enable', 'DMZ Host', and 'Source Address'. The 'Enable' label is next to a checkbox. The 'DMZ Host' and 'Source Address' labels are next to text input fields. At the bottom, there is a blue 'Save' button.

Figure 3-2-3-4

DMZ	
Item	Description
Enable	Enable or disable DMZ.
DMZ Host	Enter the IP address of the DMZ host on the internal network.
Source Address	Set the source IP address which can access to DMZ host. "0.0.0.0/0" means any address.

Table 3-2-3-4 DMZ Parameters

### 3.2.3.5 MAC Binding

MAC Binding is used for specifying hosts by matching MAC addresses and IP addresses that are in the list of allowed outer network access.

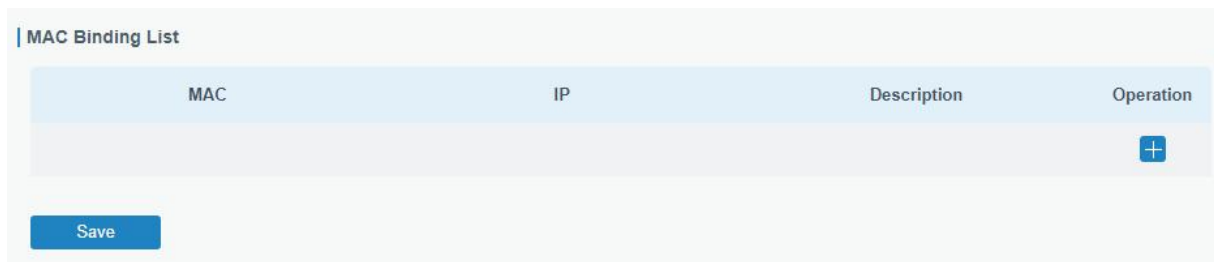

The image shows a web interface for the MAC Binding List. It has a title 'MAC Binding List' with a vertical bar to its left. Below the title, there is a table with four columns: 'MAC', 'IP', 'Description', and 'Operation'. The 'Operation' column has a blue '+' button. At the bottom, there is a blue 'Save' button.

Figure 3-2-3-5

MAC Binding List	
Item	Description
MAC Address	Set the binding MAC address.
IP Address	Set the binding IP address.
Description	Fill in a description for convenience of recording the meaning of the binding rule for each piece of MAC-IP.

Table 3-2-3-5 MAC Binding Parameters

### 3.2.3.6 Custom Rules

In this page, you can configure your own custom firewall iptables rules.

Custom Rules

Rule	Description	Operation
Eg: -t filter -I INPUT -s 192.168.3.240 -j DROP		X
		+

Save

Figure 3-2-3-6

Custom Rules	
Item	Description
Rule	Specify an iptables rule like the example shows. Tips: You must reboot the device to take effect after modifying or deleting the iptables rules.
Description	Enter the description of the rule.

Table 3-2-3-6 Custom Rules Parameters

### 3.2.3.7 SPI

SPI Firewall

- ☒ Enable
- ☐ Filter Proxy
- ☐ Filter Cookies
- ☐ Filteractivex
- ☐ Filter Java Applets
- ☒ Filter Multicast
- ☐ Filter IDENT(port 113)
- ☒ Block Wan SNMP access

- ☒ Block Anonymous Wan Request

Save

Figure 3-2-3-7

SPI Firewall	
Item	Description
Enable	Enable/disable SPI firewall.
Filter Proxy	Blocks HTTP requests containing the "Host": string.
Filter Cookies	Identifies HTTP requests that contain "Cookie": String and mangle the cookie. Attempts to stop cookies from being used.
Filter ActiveX	Blocks HTTP requests of the URL that ends in ".ocx" or ".cab".
Filter Java Applets	Blocks HTTP requests of the URL that ends in ".js" or ".class".
Filter Multicast	Prevent multicast packets from reaching the LAN.

Filter IDENT(port 113)	Prevent WAN access to Port 113.
Block WAN SNMP access	Block SNMP requests from the WAN.
Filter WAN NAT Redirection	Prevent hosts on LAN from using WAN address of router to connect servers on the LAN (which have been configured using port redirection).
Block Anonymous WAN Requests	Stop the router from responding to "pings" from the WAN.

Table 3-2-3-7 SPI Parameters

### 3.2.4 QoS

Quality of service (QoS) refers to traffic prioritization and resource reservation control mechanisms rather than the achieved service quality. QoS is engineered to provide different priority for different applications, users, data flows, or to guarantee a certain level of performance to a data flow.

The screenshot displays the QoS configuration page with two tabs: 'QoS(Download)' and 'QoS(Upload)'. The 'Download Bandwidth' section includes an 'Enable' checkbox, a 'Default Category' dropdown, a 'Download Bandwidth' input field set to '0' kbits/s, and a 'Capacity' label. Below this is the 'Service Category' section, which contains a table with columns: Name, Percent(%), Max BW(kbps), Min BW(kbps), and Operation. A '+' button is next to the Operation column. Underneath is the 'Service Category Rules' section, featuring a table with columns: Name, Source IP, Source Port, Destination IP, Destination Port, Protocol, Service Category, and Operation. Another '+' button is next to the Operation column. A 'Save' button is located at the bottom left.

Figure 3-2-4-1

QoS	
Item	Description
<b>Download/Upload</b>	
Enable	Enable or disable QoS.
Default Category	Select the default category from Service Category list.
Download/Upload Bandwidth Capacity	The download/upload bandwidth capacity of the network that the router is connected with, in kbps. Range: 1-8000000.
<b>Service Category</b>	
Name	You can use characters such digits, letters and "-".
Percent (%)	Set percent for the service category. Range: 0-100.
Max BW(kbps)	The maximum bandwidth that this category is allowed to consume, in kbps. The value should be less than the "Download/Upload Bandwidth Capacity" when the traffic is

	blocked.
Min BW(kbps)	The minimum bandwidth that can be guaranteed for the category, in kbps. The value should be less than the "MAX BW" value.
<b>Service Category Rules</b>	
Item	Description
Name	Give the rule a descriptive name.
Source IP	Source address of flow control (leaving it blank means any).
Source Port	Source port of flow control. Range: 0-65535 (leaving it blank means any).
Destination IP	Destination address of flow control (leaving it blank means any).
Destination Port	Destination port of flow control. Range: 0-65535 (leaving it blank means any).
Protocol	Select protocol from "ANY", "TCP", "UDP", "ICMP", and "GRE".
Service Category	Set service category for the rule.

Table 3-2-4-1 QoS (Download/Upload) Parameters

## Related Configuration Example

### [QoS Application Example](#)

## 3.2.5 VPN

Virtual Private Networks, also called VPNs, are used to securely connect two private networks together so that devices can connect from one network to the other network via secure channels. The UR32 supports DMVPN, IPsec, GRE, L2TP, PPTP, OpenVPN, as well as GRE over IPsec and L2TP over IPsec.

### 3.2.5.1 DMVPN

A dynamic multi-point virtual private network (DMVPN), combining mGRE and IPsec, is a secure network that exchanges data between sites without passing traffic through an organization's headquarter VPN server or router.

### 3.2.5.2 IPsec Server

IPsec is especially useful for implementing virtual private networks and for remote user access through dial-up connection to private networks. A big advantage of IPsec is that security arrangements can be handled without requiring changes to individual user computers.

IPsec provides three choices of security service: Authentication Header (AH), Encapsulating Security Payload (ESP), and Internet Key Exchange (IKE). AH essentially allows authentication of the senders' data. ESP supports both authentication of the sender and data encryption. IKE is used for cipher code exchange. All of them can protect one and more data flows between hosts, between host and gateway, and between gateways.

Figure 3-2-5-6

IKE Parameter	
Item	Description
IKE Version	Select the method of key exchange from IKEv1 and IKEv2.
Negotiation Mode	When using IKEv1, select Main or Aggressive.
Encryption Algorithm	Select DES, 3DES, AES128, AES192 or AES256.
Authentication Algorithm	Select MD5, SHA1 or SHA2-256.
DH Group	Select MODP768-1, MODP1024-2, MODP1536-5, MODP2048-14 or MODP3072-15.
Local Authentication	Select PSK or CA. <b>PSK:</b> use pre-shared key to complete the authentication. <b>CA:</b> use certificate to complete the authentication. After selecting, go to <b>Network &gt; VPN &gt; &gt; Certifications</b> page to import CA certificate, local certificate and private key to corresponding fields.
Local Secrets	Enter the pre-shared key which is defined on server side.
Remote Authentication	When using IKEv2, select PSK or CA.

	<b>PSK:</b> use pre-shared key to complete the authentication. <b>CA:</b> use certificate to complete the authentication. After selecting, go to <b>Network &gt; VPN &gt; &gt; Certifications</b> page to import remote certificate to corresponding fields.
Remote Secrets	Enter the pre-shared key which is defined on server side.
XAUTH	Enter XAUTH username and password which is defined on server side.
Lifetime (s)	Set the lifetime in IKE negotiation. Range: 60-86400.
<b>SA Parameter</b>	
SA Encryption Algorithm	Select DES, 3DES, AES128, AES192 or AES256.
SA Authentication Algorithm	Select MD5, SHA1 or SHA2-256.
PFS Group	Select NULL, MODP768-1 , MODP1024-2 or MODP1536-5.
Lifetime (s)	Set the lifetime of IPsec SA. Range: 60-86400 s.
DPD Time Interval(s)	Set DPD retry interval to send DPD requests. Range: 1-86400 s
DPD Timeout(s)	Set DPD timeout to detect the remote side fails. Range: 10-86400 s.
<b>IPsec Advanced</b>	
Enable Compression	The head of IP packet will be compressed after it's enabled.
Margintime	Set advanced time before the lifetime expires to begin the re-negotiation.
VPN Over IPsec Type	Select from NONE, GRE and L2TP.
Expert Options	User can enter some other initialization strings in this field and separate the strings with semicolon.

Table 3-2-5-5 IPsec Parameters

### 3.2.5.4 GRE

Generic Routing Encapsulation (GRE) is a protocol that encapsulates packets in order to route other protocols over IP networks. It's a tunneling technology that provides a channel through which encapsulated data message could be transmitted and encapsulation and decapsulation could be realized at both ends.

In the following circumstances the GRE tunnel transmission can be applied:

- GRE tunnel could transmit multicast data packets as if it were a true network interface. Single use of IPSec cannot achieve the encryption of multicast.
- A certain protocol adopted cannot be routed.
- A network of different IP addresses shall be required to connect other two similar networks.

The screenshot shows the 'GRE Settings' configuration page. It features a list of settings for three GRE tunnels: GRE\_1, GRE\_2, and GRE\_3. GRE\_1 is currently selected and expanded, showing the following options:

- Enable:** A checkbox that is currently unchecked.
- Remote IP Address:** An empty text input field.
- Local IP Address:** An empty text input field.
- Local Virtual IP Address:** An empty text input field.
- Netmask:** A text input field containing the value '255.255.255.0'.
- Peer Virtual IP Address:** An empty text input field.
- Global Traffic Forwarding:** A checkbox that is currently unchecked.
- Remote Subnet:** An empty text input field.
- Remote Netmask:** An empty text input field.
- MTU:** A text input field containing the value '1500'.
- Key:** An empty text input field.
- Enable NAT:** A checkbox that is currently checked.

Below the GRE\_1 settings, there are expandable sections for GRE\_2 and GRE\_3, each indicated by a plus sign (+).

Figure 3-2-5-7

GRE	
Item	Description
Enable	Check to enable GRE function.
Remote IP Address	Enter the real remote IP address of GRE tunnel.
Local IP Address	Set the local IP address.
Local Virtual IP Address	Set the local tunnel IP address of GRE tunnel.
Netmask	Set the local netmask.
Peer Virtual IP Address	Enter remote tunnel IP address of GRE tunnel.
Global Traffic Forwarding	All the data traffic will be sent out via GRE tunnel when this function is enabled.
Remote Subnet	Enter the remote subnet IP address of GRE tunnel.
Remote Netmask	Enter the remote netmask of GRE tunnel.
MTU	Enter the maximum transmission unit. Range: 64-1500.
Key	Set GRE tunnel key.
Enable NAT	Enable NAT traversal function.

Table 3-2-5-6 GRE Parameters

### 3.2.5.5 L2TP

Layer Two Tunneling Protocol (L2TP) is an extension of the Point-to-Point Tunneling Protocol (PPTP) used by an Internet service provider (ISP) to enable the operation of a virtual private network (VPN) over the Internet.

### 3.2.5.6 PPTP

Point-to-Point Tunneling Protocol (PPTP) is a protocol that allows corporations to extend their own corporate network through private "tunnels" over the public Internet. Effectively, a corporation uses a wide-area network as a single large local area network.

The screenshot displays the 'PPTP Settings' configuration page. At the top, there's a tab labeled 'PPTP Settings'. Below it, three expandable sections are visible: 'PPTP\_1' (currently expanded), 'PPTP\_2', and 'PPTP\_3'. The 'PPTP\_1' section contains the following settings:

- Enable:** A checkbox that is currently unchecked.
- Remote IP Address:** A text input field.
- Username:** A text input field.
- Password:** A text input field.
- Authentication:** A dropdown menu with 'Auto' selected.
- Global Traffic Forwarding:** A checkbox that is currently unchecked.
- Remote Subnet:** A text input field.
- Remote Subnet Mask:** A text input field.
- Advanced Settings:** A link icon (represented by a square with an 'x') to expand further options.

At the bottom of the settings area, there is a blue 'Save' button.

Figure 3-2-5-10

PPTP	
Item	Description
Enable	Enable PPTP client. A maximum of 3 tunnels is allowed.
Remote IP Address	Enter the public IP address or domain name of PPTP server.
Username	Enter the username that PPTP server provides.
Password	Enter the password that PPTP server provides.
Authentication	Select from "Auto", "PAP", "CHAP", "MS-CHAPv1", and "MS-CHAPv2".
Global Traffic Forwarding	All of the data traffic will be sent out via PPTP tunnel once enable this function.
Remote Subnet	Set the peer subnet of PPTP.
Remote Subnet Mask	Set the netmask of peer PPTP server.

### 3.2.5.7 OpenVPN Client

OpenVPN is an open source virtual private network (VPN) product that offers a simplified security

framework, modular network design, and cross-platform portability. The default OpenVPN version of UR32 is 2.4.9.

UR32 supports running at most 3 OpenVPN clients at the same time. You can import the ovpn file directly or configure the parameters on this page to set clients.

NetworkID	The ZeroTier virtual Ethernet network that the device will join.
Interface Name	Display the name of the virtualized network interface to which the router is added.
Allow Managed Addresses	Allow or disables the ZeroTier controller to dynamically assign IP addresses and configure routing information when the router joins the network.
Allow Assignment of	Allow or disallow ZeroTier network controllers to assign worldwide

Global IPs	IPv6 addresses.
Allow Default Route Override	Allow or disallow the router to override the default route settings when connecting to the ZeroTier network.

Table 3-2-5-18

### 3.2.6 IP Passthrough

IP Passthrough mode shares or "passes" the Internet providers assigned IP address to a single LAN client device connected to the router.

Figure 3-2-6-1

IP Passthrough	
Item	Description
Enable	Enable or disable IP Passthrough.
Passthrough Mode	Select passthrough mode from DHCP-Fixed and DHCP-Dynamic.
MAC	Set MAC address when mode is DHCP-Fixed.

Table 3-2-6-1 IP Passthrough Parameters

### 3.2.7 Routing

#### 3.2.7.1 Static Routing

A static routing is a manually configured routing entry. Information about the routing is manually entered rather than obtained from dynamic routing traffic. After setting static routing, the package for the specified destination will be forwarded to the path designated by user.

Figure 3-2-7-1

Static Routing	
Item	Description
Destination	Enter the destination IP address.
Netmask/Prefix Length	Enter the subnet mask or prefix length of destination address.
Interface	The interface through which the data can reach the destination address.
Gateway	IP address of the next router that will be passed by before the input data reaches the destination address.
Distance	Priority, smaller value refers to higher priority. Range: 1-255.

Table 3-2-7-1 Static Routing Parameters

### 3.2.7.2 RIP

RIP is mainly designed for small networks. RIP uses Hop Count to measure the distance to the destination address, which is called Metric. In RIP, the hop count from the router to its directly connected network is 0 and the hop count of network to be reached through a router is 1 and so on. In order to limit the convergence time, the specified metric of RIP is an integer in the range of 0 - 15 and the hop count larger than or equal to 16 is defined as infinity, which means that the destination network or host is unreachable. Because of this limitation, the RIP is not suitable for large-scale networks. To improve performance and prevent routing loops, RIP supports split horizon function. RIP also introduces routing obtained by other routing protocols.

Each router that runs RIP manages a routing database, which contains routing entries to reach all reachable destinations.

Split-Horizon	Select from "enable" and "disable".
Authentication Mode	Select from "text" and "md5".
Authentication String	The authentication key for package interaction in RIPV2.
Authentication Key-chain	The authentication key-chain for package interaction in RIPV2.
<b>Neighbor</b>	
IP Address	Set RIP neighbor's IP address manually.
<b>Network</b>	
IP Address	The IP address of interface for RIP publishing.
Netmask	The netmask of interface for RIP publishing.

Table 3-2-7-3

### 3.2.7.3 OSPF

OSPF, short for Open Shortest Path First, is a link status based on interior gateway protocol developed by IETF.

If a router wants to run the OSPF protocol, there should be a Router ID that can be manually configured. If no Router ID configured, the system will automatically select an IP address of interface as the Router ID. The selection order is as follows:

- If a Loopback interface address is configured, then the last configured IP address of Loopback interface will be used as the Router ID;
- If no Loopback interface address is configured, the system will choose the interface with the biggest IP address as the Router ID.

#### Five types of packets of OSPF:

- **Hello packet**
- **DD packet** (Database Description Packet)
- **LSR packet** (Link-State Request Packet)
- **LSU packet** (Link-State Update Packet)
- **LSAck packet** (Link-Sate Acknowledgment Packet)

#### Neighbor and Neighboring

After OSPF router starts up, it will send out Hello Packets through the OSPF interface. Upon receipt of Hello packet, OSPF router will check the parameters defined in the packet. If it's consistent, a neighbor relationship will be formed. Not all matched sides in neighbor relationship can form the adjacency relationship. It is determined by the network type. Only when both sides successfully exchange DD packets and LSDB synchronization is achieved, the adjacency in the true sense can be formed. LSA describes the network topology around a router, LSDB describes entire network topology.

Reference Bandwidth	<input type="text" value="100"/> mbit

Figure 3-2-7-4

OSPF	
Item	Description
Enable	Enable or disable OSPF.
Router ID	Router ID (IP address) of the originating LSA.
ABR Type	Select from cisco, ibm, standard and shortcut.

RFC1583 Compatibility	Enable/Disable.
OSPF Opaque-LSA	Enable/Disable LSA: a basic communication means of the OSPF routing protocol for the Internet Protocol (IP).
SPF Delay Time	Set the delay time for OSPF SPF calculations. Range: 0-6000000, in milliseconds.
SPF Initial-holdtime	Set the initialization time of OSPF SPF. Range: 0-6000000, in milliseconds.
SPF Max-holdtime	Set the maximum time of OSPF SPF. Range: 0-6000000, in milliseconds.
Reference Bandwidth	Range: 1-4294967, in Mbit.

Table 3-2-7-4 OSPF Parameters

Interface

Interface	Hello Interval(s)	Dead Interval(s)	Retransmit Interval(s)	Transmit Delay(s)	Operation
Bridge0	10	40	5	1	 

Interface Advanced Options ☒

Interface	Network	Cost	Priority	Authentication	Key ID	Key	Operation
Bridge	broad	10	1				 

Figure 3-2-7-5

Item	Description
<b>Interface</b>	
Interface	Select interface from "cellular0", "WAN" and "Bridge0".
Hello Interval (s)	Send interval of Hello packet. If the Hello time between two adjacent routers is different, the neighbour relationship cannot be established. Range: 1-65535.
Dead Interval (s)	Dead Time. If no Hello packet is received from the neighbours within the dead time, then the neighbour is considered failed. If dead times of two adjacent routers are different, the neighbour relationship cannot be established.
Retransmit Interval (s)	When the router notifies an LSA to its neighbour, it is required to make acknowledgement. If no acknowledgement packet is received within the retransmission interval, this LSA will be retransmitted to the neighbour. Range: 3-65535.
Transmit Delay (s)	It will take time to transmit OSPF packets on the link. So a certain delay time should be increased before transmission the aging time of LSA. This configuration needs to be further considered on the low-speed link. Range: 1-65535.

Interface Advanced Options	
Interface	Select interface.
Network	Select OSPF network type.
Cost	Set the cost of running OSPF on an interface. Range: 1-65535.
Priority	Set the OSPF priority of interface. Range: 0-255.
Authentication	Set the authentication mode that will be used by the OSPF area. Simple: a simple authentication password should be configured and confirmed again. MD5: MD5 key & password should be configured and confirmed again.
Key ID	It only takes effect when MD5 is selected. Range 1-255.
Key	The authentication key for OSPF packet interaction.

Table 3-2-7-5 OSPF Parameters

The screenshot shows a web-based configuration interface for OSPF. It contains four main sections, each with a table of fields and an 'Add' button (represented by a blue square with a white plus sign).

- Passive Interface:** A single table with one column labeled 'Passive Interface' and one column labeled 'Operation'.
- Network:** A table with four columns: 'IP Address', 'Netmask', 'Area ID', and 'Operation'.
- Neighbor:** A table with four columns: 'IP Address', 'Priority', 'Poll', and 'Operation'.
- Area:** A table with five columns: 'Area ID', 'Area', 'No Summary', 'Authentication', and 'Operation'.

Figure 3-2-7-6

Item	Description
<b>Passive Interface</b>	
Passive Interface	Select interface from "cellular0", "LAN1/WAN" and "Bridge0".
<b>Network</b>	
IP Address	The IP address of local network.
Netmask	The netmask of local network.
Area ID	The area ID of original LSA's router.
<b>Area</b>	
Area ID	Set the ID of the OSPF area (IP address).
Area	Select from "Stub" and "NSSA". The backbone area (area ID 0.0.0.0) cannot be set as "Stub" or "NSSA".
No Summary	Forbid route summarization.
Authentication	Select authentication from "simple" and "md5".

Routing Filtering	
Item	Description
<b>Access Control List</b>	
Name	User-defined name, need to start with a letter. Only letters, digits and underline (_) are allowed.
Action	Select from "permit" and "deny".
Match Any	No need to set IP address and subnet mask.
IP Address	User-defined.
Netmask	User-defined.
<b>IP Prefix-List</b>	
Name	User-defined name, need to start with a letter. Only letters, digits and underline (_) are allowed.
Sequence Number	A prefix name list can be matched with multiple rules. One rule is matched with one sequence number. Range: 1-4294967295.
Action	Select from "permit" and "deny".
Match Any	No need to set IP address, subnet mask, FE Length, and LE Length.
IP Address	User-defined.
Netmask	User-defined.
FE Length	Specify the minimum number of mask bits that must be matched. Range: 0-32.
LE Length	Specify the maximum number of mask bits that must be matched. Range: 0-32.

Table 3-2-7-9 Routing Filtering Parameters

### 3.2.8 VRRP

The Virtual Router Redundancy Protocol (VRRP) is a computer networking protocol that provides automatic assignment of available Internet Protocol (IP) routers for participating hosts. This increases the availability and reliability of routing paths via automatic default gateway selections in an IP sub-network.

Increasing the number of exit gateway is a common method for improving system reliability. VRRP adds a group of routers that undertake gateway function into a backup group so as to form a virtual router. The election mechanism of VRRP will decide which router undertakes the forwarding task, and

the host in LAN is only required to configure the default gateway for the virtual router.

In VRRP, routers need to be aware of failures in the virtual master router. To achieve this, the virtual master router sends out multicast “alive” announcements to the virtual backup routers in the same VRRP group.

The VRRP router who has the highest number will become the virtual master router. The VRRP router number ranges from 1 to 255 and usually we use 255 for the highest priority and 100 for backup.

If the current virtual master router receives an announcement from a group member (Router ID) with a higher priority, then the latter will pre-empt and become the virtual master router.

VRRP has the following characteristics:

- The virtual router with an IP address is known as the Virtual IP address. For the host in LAN, it is only required to know the IP address of virtual router, and set it as the address of the next hop of the default route.
- The network Host communicates with the external network through this virtual router.
- A router will be selected from the set of routers based on its priority to undertake the gateway function. Other routers will be used as backup routers to perform the duties of gateway for the gateway router in the case of any malfunction, so as to guarantee uninterrupted communication between the host and external network.

When interface connected with the uplink is at the state of Down or Removed, the router actively lowers its priority so that priority of other routers in the backup group will be higher. Thus the router with the highest priority becomes the gateway for the transmission task.

**VRRP**

**VRRP Status**

Status: DISABLE

**VRRP Settings**

Enable: ☐

Interface: Bridge0

Virtual Router ID: 1

Virtual IP:

Priority: 100

Advertisement Interval (s): 1

Preemption Mode: ☐

IPv4 Primary Server: 8.8.8.8

IPv4 Secondary Server: 114.114.114.114

Interval: 300 s

Retry Interval: 5 s

Timeout: 3 s

Max Ping Retries: 3

Save

Figure 3-2-8-1

VRRP		
Item	Description	Default
Enable	Enable or disable VRRP.	Disable
Interface	Select the interface of Virtual Router.	None

Virtual Router ID	User-defined Virtual Router ID. Range: 1-255.	None
Virtual IP	Set the IP address of Virtual Router.	None
Priority	The VRRP priority range is 1-254 (a bigger number indicates a higher priority). The router with higher priority will be more likely to become the gateway router.	100
Advertisement Interval (s)	Heartbeat package transmission time interval between routers in the virtual ip group. Range: 1-255.	1
Preemption Mode	If the router works in the preemption mode, once it finds that its own priority is higher than that of the current gateway router, it will send VRRP notification package, resulting in re-election of gateway router and eventually replacing the original gateway router. Accordingly, the original gateway router will become a Backup router.	Disable
IPV4 Primary Server	The router will send ICMP packet to the IP address or host name to determine whether the Internet connection is still available or not.	8.8.8.8
IPV4 Secondary Server	The router will try to ping the secondary server name if primary server is not available.	223.5.5.5
Interval	Time interval (in seconds) between two Pings.	300
Retry Interval	Set the ping retry interval. When ping failed, the router will ping again every retry interval.	5
Timeout	The maximum amount of time the router will wait for a response to a ping request. If it does not receive a response for the amount of time defined in this field, the ping request will be considered as failure.	3
Max Ping Retries	The retry times of the router sending ping request until determining that the connection has failed.	3

#### 3.2.9 DDNS

Dynamic DNS (DDNS) is a method that automatically updates a name server in the Domain Name System, which allows user to alias a dynamic IP address to a static domain name.

DDNS serves as a client tool and needs to coordinate with DDNS server. Before starting configuration, user shall register on a website of proper domain name provider and apply for a domain name.

### 3.3 System

#### 3.3.1 General Settings

##### 3.3.1.1 General

General settings include system info and HTTPS certificates.

The screenshot shows the 'System' configuration page. Under the 'System' tab, there are three settings: 'Hostname' set to 'ROUTER', 'Web Login Timeout(s)' set to '1800', and 'Encrypting Cleartext Passwords' which is checked. Below this is the 'HTTPS Certificates' section. It has two rows: 'Certificate' and 'Key'. Each row has a text input field (containing 'https.crt' and 'https.key' respectively), followed by four buttons: 'Browse' (blue), 'Import' (grey), 'Export' (blue), and 'Delete' (blue). At the bottom of the form is a large blue 'Save' button.

Figure 3-3-1-1

General		
Item	Description	Default
<b>System</b>		
Hostname	User-defined router name, needs to start with a letter.	ROUTER
Web Login Timeout (s)	You need to log in again if it times out. Range: 100-3600.	1800
Encrypting Cleartext Passwords	This function will encrypt all of cleartext passwords into ciphertext passwords.	Enable
<b>HTTPS Certificates</b>		
Certificate	Click "Browse" button, choose certificate file on the PC, and then click "Import" button to upload the file into router. Click "Export" button will export the file to the PC. Click "Delete" button will delete the file.	--
Key	Click "Browse" button, choose key file on the PC, and then click "Import" button to upload the file into router. Click "Export" button will export file to the PC. Click "Delete" button will delete the file.	--

### 3.3.2 Phone&SMS

#### 3.3.2.1 Phone

Phone settings involve in call/SMS trigger, SMS control and SMS alarm for events.

The screenshot shows two web interfaces for phone settings. The top interface, titled 'Phone Number List', has a table with columns: Number, Description, and Operation. It contains two rows of data: one with Number '1908888888' and Description 'test', and another with Number '8866222222' and Description 'ttest'. Each row has a delete icon (X) in the Operation column, and a plus icon (+) is at the bottom right. The bottom interface, titled 'Phone Group List', has a table with columns: Group ID, Description, Number, and Operation. It contains one row of data: Group ID '1', Description 'test', and Number '1908888888,8866222222' (shown in a dropdown menu). It also has a delete icon (X) and a plus icon (+) in the Operation column.

Account	
Item	Description
Username	Enter a new username. You can use characters such as a-z, 0-9, "_", "-". The first character can't be a digit.
Old Password	Enter the old password.
New Password	Enter a new password. You can use any ASCII characters except blank.
Confirm New Password	Enter the new password again.

Table 3-3-3-1 Account Settings

### 3.3.3.2 User Management

This section describes how to create common user accounts. The common user permission includes Read-Only and Read-Write.

The screenshot shows the 'User Management' tab with a 'User List' section. It contains a table with four columns: 'Username', 'Password', 'Permission', and 'Operation'. The 'Username' and 'Password' columns have input fields. The 'Permission' column has a dropdown menu currently set to 'Read-Only'. The 'Operation' column contains a '+' icon for adding new users and an 'x' icon for deleting existing users.

Figure 3-3-3-2

User Management	
Item	Description
Username	Enter a new username. You can use characters such as a-z, 0-9, "_", "-". The first character can't be a digit.
Password	Set password. You can use any ASCII characters except blank.
Permission	Select user permission from "Read-Only" and "Read-Write". <b>Read-Only:</b> users can only view the configuration of router in this level. <b>Read-Write:</b> users can view and set the configuration of router in this level.

Table 3-3-3-2 User Management

### 3.3.4 AAA

AAA access control is used for visitors control and the available corresponding services once access is allowed. It adopts the same method to configure three independent safety functions. It provides modularization methods for following services:

- Authentication: verify if the user is qualified to access to the network.
- Authorization: authorize related services available for the user.
- Charging: record the utilization of network resources.

#### 3.3.4.1 Radius

Using UDP for its transport, Radius is generally applied in various network environments with higher requirements of security and permission of remote user access.

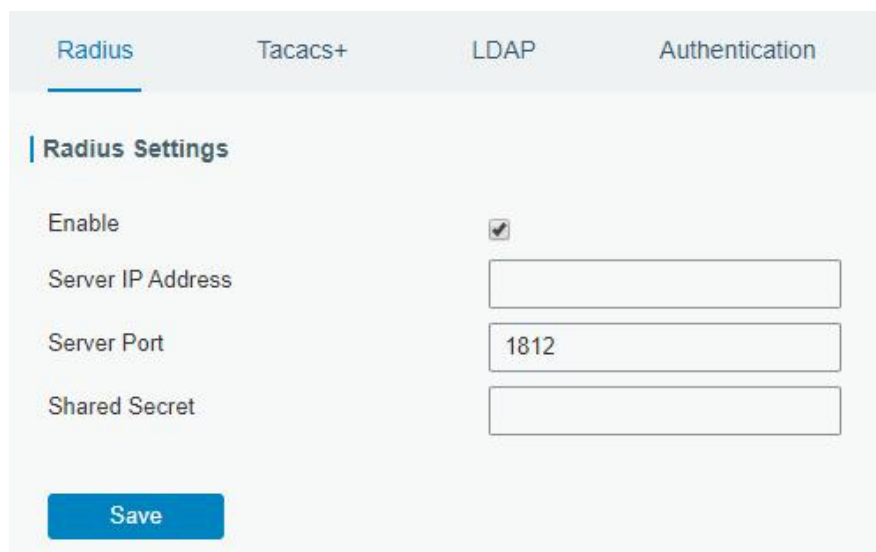

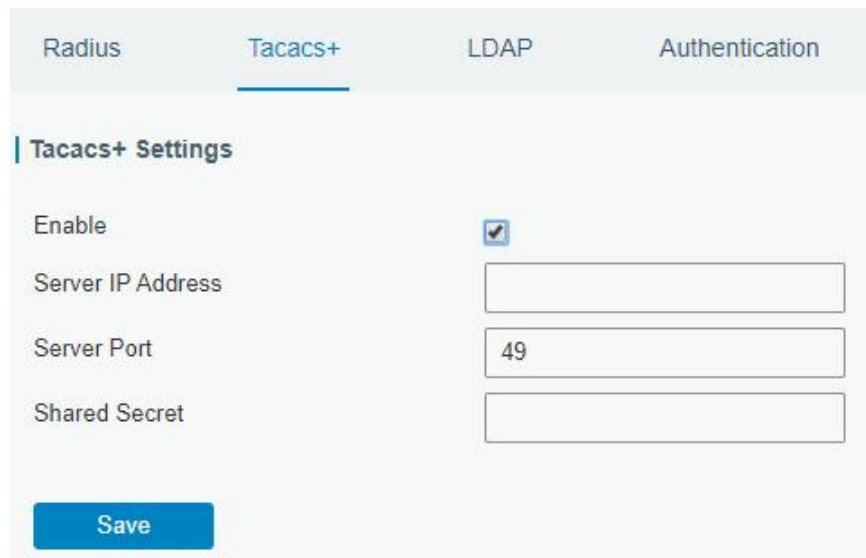

Figure 3-3-4-1

Radius	
Item	Description
Enable	Enable or disable Radius.
Server IP Address	Fill in the Radius server IP address/domain name.
Server Port	Fill in the Radius server port. Range: 1-65535.
Key	Fill in the key consistent with that of Radius server in order to get connected with Radius server.

Table 3-3-4-1 Radius Parameters

#### 3.3.4.2 TACACS+

Using TCP for its transport, TACACS+ is mainly used for authentication, authorization and charging of the access users and terminal users by adopting PPP and VPDN.

The screenshot shows the 'TACACS+' tab selected in the configuration menu. The 'TACACS+ Settings' section contains the following fields:

- Enable:** A checkbox that is currently checked.
- Server IP Address:** An empty text input field.
- Server Port:** A text input field containing the value '49'.
- Shared Secret:** An empty text input field.

A blue 'Save' button is located at the bottom left of the settings area.

Figure 3-3-4-2

TACACS+	
Item	Description
Enable	Enable or disable TACACS+.
Server IP Address	Fill in the TACACS+ server IP address/domain name.
Server Port	Fill in the TACACS+ server port. Range: 1-65535.
Key	Fill in the key consistent with that of TACACS+ server in order to get connected with TACACS+ server.

Table 3-3-4-2 TACACS+ Parameters

### 3.3.4.3 LDAP

A common usage of LDAP is to provide a central place to store usernames and passwords. This allows many different applications and services to connect the LDAP server to validate users.

LDAP is based on a simpler subset of the standards contained within the [X.500](#) standard. Because of this relationship, LDAP is sometimes called X.500-lite as well.

Figure 3-3-4-3

LDAP	
Item	Description
Enable	Enable or Disable LDAP.
Server IP Address	Fill in the LDAP server's IP address/domain name. The maximum count is 10.
Server Port	Fill in the LDAP server's port. Range: 1-65535
Base DN	The top of LDAP directory tree.
Security	Select secure method from "None", "StartTLS" and "SSL".
Username	Enter the username to access the server.
Password	Enter the password to access the server.

Table 3-3-5-3 LDAP Parameters

### 3.3.4.4 Authentication

AAA supports the following authentication ways:

- None: uses no authentication, generally not recommended.
- Local: uses the local username database for authentication.
  - Advantages: rapidness, cost reduction.
  - Disadvantages: storage capacity limited by hardware.
- Remote: has user's information stored on authentication server. Radius, TACACS+ and LDAP supported for remote authentication.

When radius, TACACS+, and local are configured at the same time, the priority level is: 1 > 2 > 3.

DTU Protocol	<p>Select from below protocols:</p> <p><b>Transparent:</b> the router is used as TCP/UDP client and transmits data to server transparently.</p> <p><b>TCP server:</b> the router is used as TCP server to wait for polling data.</p> <p><b>UDP server:</b> the router is used as UDP server to wait for polling data.</p> <p><b>Modbus:</b> the router will be used as Modbus gateway, which can achieve conversion between Modbus RTU and Modbus TCP.</p> <p><b>MQTT:</b> the router will be used as MQTT client to forward data to MQTT broker or forward downlink to serial port.</p>	--
TCP/UDP Server		
Listening port	Set the router listening port. Range: 1-65535.	502
Keepalive Interval	After TCP connection is established, client will send heartbeat packet regularly by TCP to keep alive. The interval range is 1-3600s.	75

Keepalive Retry Times	When TCP heartbeat times out, router will resend heartbeat. After it reaches the preset retry times, TCP connection will be reestablished. The retry times range is 1-16.	9
Packet Size	Set the size of the serial data frame. Packet will be sent out when preset frame size is reached. The size range is 1-1024 bytes.	1024
Serial Frame Interval	The interval that the router sends out real serial data stored in the buffer area to public network. The range is 10-65535 ms. <b>Note:</b> data will be sent out to public network when real serial data size reaches the preset packet size, even though it's within the serial frame interval.	100

Table 3-4-2-2 DTU Parameters

Item	Description	Default
<b>Transparent</b>		
Protocol	Select TCP or UDP protocol.	TCP
Keepalive Interval (s)	After TCP client is connected with TCP server, the client will send heartbeat packet by TCP regularly to keep alive. The interval range is 1-3600 s.	75
Keepalive Retry Times	When TCP heartbeat times out, the router will resend heartbeat. After it reaches the preset retry times, router will reconnect to TCP server. The range is 1-16.	9
Packet Size	Set the size of the serial data frame. Packet will be sent out when preset frame size is reached. The range is 1-1024 bytes.	1024
Serial Frame Interval	The interval that the router sends out real serial data stored in the buffer area to public network. The range is 10-65535 ms. <b>Note:</b> data will be sent out to public network when real serial data size reaches the preset packet size, even though it's within the serial frame interval.	100
Reconnect Interval	After connection failure, router will reconnect to the server at the preset interval. The range is 10-60 s.	10
Specific Protocol	By Specific Protocol, the router will be able to connect to the TCP2COM software.	--
Heartbeat Interval	By Specific Protocol, the router will send heartbeat packet to the server regularly to keep alive. The interval range is 1-3600 s.	30
ID	Define unique ID of each router. No longer than 63 characters without space character.	--
Register String	Define register string for connection with the server.	Null
Server Address	Fill in the TCP or UDP server address (IP/domain name).	Null
Server Port	Fill in the TCP or UDP server port. Range: 1-65535.	Null
Status	Show the connection status between the router and the server.	--
<b>Modbus</b>		
Local Port	Set the router listening port. Range: 1-65535.	502
Maximum TCP Clients	Specify the maximum number of TCP clients allowed to connect to the router which act as a TCP server.	32

Connection Timeout	If the TCP server does not receive any data from the slave device within the connection timeout period, the TCP connection will be broken.	60
Reading Interval	Set the interval for reading remote channels. When a read cycle ends, the new read cycle begins until this interval expires. If it is set to 0, the device will restart the new read cycle after all channels have been read.	100
Response Timeout	Set the maximum response time that the router waits for the response to the command. If the device does not get a response after the maximum response time, it's determined that the command has timed out.	3000
Maximum Retries	Set the maximum retry times after it fails to read.	3
<b>MQTT</b>		
Packet Size	Set the size of the serial data frame. Packet will be sent out when preset frame size is reached. The range is 1-1024 bytes.	1024
Serial Frame Interval	The interval that the router sends out real serial data stored in the buffer area to public network. The range is 10-65535 ms. <b>Note:</b> data will be sent out to public network when real serial data size reaches the preset packet size, even though it's within the serial frame interval.	100
MQTT Connection	Select the MQTT connection to send serial port data, it's set up on <b>Service &gt; MQTT</b> page.	Null
Type	Select Uplink or Downlink for this transparent. Every type supports to add 10 connections at most.	Null
Topic	Topic name used for publishing serial port data.	Null
Retain	Enable to set the latest message of this topic as retain message.	Null
QoS	QoS0, QoS1 or QoS2 are optional.	Null

### 3.4.4 Modbus Client (Master)

UR32 router can be set as Modbus Client to poll the remote Modbus Server and send alarm according to the response.

#### 3.4.4.1 Modbus Client

**Modbus Client Setting**

Enable ☒

Read Interval  s

Max. Retries

Max. Response Time  ms

Execution Interval  ms

Channel Name

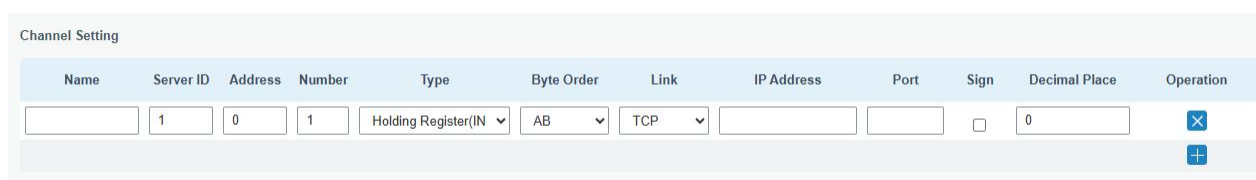

Figure 3-4-4-1

Modbus Client		
Item	Description	Default
Enable	Enable/disable Modbus client.	--
Read Interval/s	Set the interval for reading remote channels. When the read cycle ends, the commands which haven't been sent out will be discard, and the new read cycle begins. If it is set to 0, the device will restart the new read cycle after all channels have been read. Range: 0-600.	0
Max. Retries	Set the maximum retry times after it fails to read, range: 0-5.	3
Max. Response Time/ms	Set the maximum response time that the router waits for the response to the command. If the device does not get a response after the maximum response time, it's determined that the command has timed out. Range: 10-1000.	500
Execution Interval/ms	The execution interval between each command. Range: 10-1000.	50
Channel Name	Select a readable channel form the channel list.	--

Table 3-4-4-1

### 3.4.4.2 Channel

You can add the channels and configure alarm setting on this page, so as to connect the router to the remote Modbus Server to poll the address on this page and receive alarms from the router in different conditions.

**Channel Setting**

Name	Server ID	Address	Number	Type	Byte Order	Link	IP Address	Port	Sign	Decimal Place	Operation
<input type="text"/>	<input type="text" value="1"/>	<input type="text" value="0"/>	<input type="text" value="1"/>	Holding Register(IN)	AB	TCP	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>	<input type="text" value="0"/>	<input type="button" value="X"/>
											<input type="button" value="+"/>

Figure 3-4-4-2

Channel Setting	
Item	Description
Name	Set the name to identify the remote channel. It cannot be blank.
Server ID	Set Modbus server ID.
Address	The starting address for Modbus reading.
Number	The reading quantity from starting address.
Type	Read command data type, options are Coil, Discrete, Holding Register (INT16), Input Register (INT16), Holding Register (INT32) and Holding Register (Float).
Byte Order	Order of storage or transmission of multibyte data. Big-Endian: AB, ABCD; Little-Endian: BA, CDAB; Mixed-Endian: BADC, DCBA
Link	Select serial port or TCP connection. <b>Serial Port:</b> the router communicates with devices via Modbus RTU protocol. <b>TCP:</b> the router communicates with devices via Modbus TCP protocol.
IP address	When link is TCP, fill in the IP address of the remote Modbus TCP device.
Port	When link is TCP, fill in the port of the remote Modbus TCP device.
Sign	When type is holding register or input register, enable or disable to identify whether this channel is signed.
Decimal Place	When type is holding register or input register, indicate a dot in the read into the position of the channel. For example: read the channel value is 1234 and a Decimal Place is equal to 2, then the actual value is 12.34.

Figure 3-4-4-3

Alarm Setting	
Item	Description
Name	Set the same name with the channel name to identify the remote channel.

Condition	The condition that triggers alert.
Min. Threshold	Set the min. value to trigger the alert. When the actual value is less than this value, the alarm will be triggered.
Max. Threshold	Set the max. value to trigger the alert. When the actual value is more than this value, the alarm will be triggered.
Alarm	Select the alarm method as SMS or Email.
SMS	The preset alarm content will be sent to the specified phone number.
Phone Group	Select the phone group to receive the alarm SMS.
Email Group	Select the Email group to receive the alarm Email.
Normal Content	When the actual value is restored to the normal value from exceeding the threshold value, the router will automatically cancel the abnormal alarm and send the preset normal content to the specified phone group.
Abnormal Content	When the actual value exceeds the preset threshold, the router will automatically trigger the alarm and send the preset abnormal content to the specified phone group.
Continuous Alarm	Once it is enabled, the same alarm will be continuously reported. Otherwise, the same alarm will be reported only one time.

When you want to receive GPS data, you should enable GPS function on this page.

Figure 3-4-5-1

#### 3.4.5.1 GPS IP Forwarding

GPS IP forwarding means that GPS data can be forwarded over the Internet.

Figure 3-4-5-2

Figure 3-4-5-3

GPS IP Forwarding		
Item	Description	Default
Enable	Forward the GPS data to the client or server.	Disable
Type	Select connection type of the router as Client or Server.	Client
Protocol	Select protocol of data transmission as TCP or UDP.	TCP
Keepalive Interval	After it's connected with server/client, the router will send heartbeat packet regularly to the server/client to keep alive. The interval range is 1-3600 s.	75
Keepalive Retry	When TCP heartbeat times out, the router will resend heartbeat. After it reaches the preset retry times, router will reconnect to TCP server. The range is 1-16.	9
Local Port	Set the router listening port. Range: 1-65535.	
Reconnect Interval	After connection failure, router will reconnect to the server at the preset interval. The range is 10-60 s.	10
Report Interval	Router will send GPS data to the server/client at the preset interval. The range is 1-60 s.	30
Include RMC	RMC includes time, date, position, course and speed data.	--
Include GSA	GSA includes GPS receiver operating mode, satellites used in the position solution, and DOP values.	--
Include GGA	GGA includes time, position and fix type data.	--
Include GSV	GSV includes the number, elevation, azimuth of GPS satellites and SNR values.	--
Message Prefix	Add a prefix to the GPS data.	Null
Message Suffix	Add a suffix to the GPS data.	Null
Destination IP Address		
Server Address	Fill in the server address to receive GPS data (IP/domain name).	--
Server Port	Fill in the port to receive GPS data. Range: 1-65535.	--
Status	Show the connection status between the router and the server.	--

				<span>+</span>

Figure 3-4-5-5

### GPS MQTT Forward

Item	Description	Default
Enable	Forward the GPS data to MQTT broker automatically.	Disable
Trap Interval	The interval to locate and forward the GPS data to the MQTT broker. The range is 1-60 s.	30
Include RMC	RMC includes time, date, position, course and speed data.	--
Include GSA	GSA includes GPS receiver operating mode, satellites used in the position solution, and DOP values.	--
Include GGA	GGA includes time, position and fix type data.	--
Include GSV	GSV includes the number, elevation, azimuth of GPS satellites and SNR values.	--
<b>MQTT Forward</b>		
MQTT Connections	Select the MQTT connection to send GPS data, it's set up on <b>Service &gt; MQTT</b> page.	
Topic	Topic name for publishing GPS raw data.	
Retain	Enable to set the latest message of this topic as retain message.	
QoS	QoS0, QoS1 or QoS2 are optional.	

Table 3-4-5-3 GPS MQTT Forward Parameters

### 3.4.6 MQTT

UR32 supports to work as MQTT client to forward data and router information to MQTT broker in two ways:

1. Users send requests to the router to enquire the router information;
2. The router publishes the data automatically.

ID	Name	Address	Status	Operation
1	mqtttest1	192.168.44.54:1883	Connected	
2	555	666:1883	Disconnected

Figure 3-4-6-3

MQTT Settings	
Item	Description
Status	Show connection status between router and MQTT broker.
<b>General</b>	
Name	Customize a unique connection name. It is not allowed to change after save.
Enable	Enable or disable this MQTT connection.
Broker Address	MQTT broker address to receive data.
Broker Port	MQTT broker port to receive data.
Client ID	Client ID is the unique identity of the client to the server. It must be unique when all clients are connected to the same server, and it is the key to handle messages at QoS 1 and 2.
Connection Timeout/s	If the client does not get a response after the connection timeout, the connection will be considered as broken. The Range: 1-65535.
Keep Alive Interval/s	After the client is connected to the server, the client will send heartbeat packet to the server regularly to keep alive. Range: 1-65535.
Auto	When connection is broken, try to reconnect the server automatically.

Reconnect	
Reconnect Period	When connection is broken, the period to reconnect the server periodically.
Clean Session	When enabled, the connection will create a temporary session and all information will lose when the client is disconnected from broker; when disabled, the connection will create a persistent session that will remain and save offline messages until the session logs out overtime.
<b>User Credentials</b>	
Enable	Enable user credentials.
Username	The username used for connecting to the MQTT broker.
Password	The password used for connecting to the MQTT broker.
<b>TLS</b>	
Enable	Enable the TLS encryption in MQTT communication.
Mode	Select from Self signed certificates, CA signed server certificate. <b>CA signed server certificate:</b> verify with the certificate issued by Certificate Authority (CA) that pre-loaded on the device. <b>Self signed certificates:</b> upload the custom CA certificates, client certificates and secret key for verification.
<b>Last Will and Testament</b>	
Enable	Last will message is automatically sent when the MQTT client is abnormally disconnected. It is usually used to send device status information or inform other devices or proxy servers of the device's offline status.
Last-Will Topic	Customize the topic to receive last will messages.
Last-Will QoS	QoS0, QoS1 or QoS2 are optional.
Last-Will Retain	Enable to set last will message as retain message.
Last-Will Payload	Customize the last will message contents.
<b>Request and Response Topic</b>	
Topic	The router supports to send requests to enquire router information. <b>Status Request:</b> users is able to send requests to this topic to enquire router information. Request format: <pre>{   "id": "1",   "status": "systeminfo",   "sn": "64E1213132456",   "need_response": 1    //1 means need response }</pre> The id is a random value, and the status can be set as 5 types: systeminfo, systemstatus, cellular, ethernet, gps. <b>Status Response:</b> users is able to subscribe this topic to get the replies.
Retain	Enable to set the latest message of this topic as retain message.
QoS	QoS0, QoS1 or QoS2 are optional.
<b>System Status Publish Topic</b>	

Data Type	Data type sent to MQTT broker automatically. Note that the GPS in this page is not raw data but decoded location data.
Topic	Topic name of the data type used for publishing.
Publish Interval (s)	The interval to publish data to MQTT broker automatically.
Retain	Enable to set the latest message of this topic as retain message.
QoS	QoS0, QoS1 or QoS2 are optional.

Table 3-4-6-1 MQTT Parameters

### 3.4.7 SNMP

SNMP is widely used in network management for network monitoring. SNMP exposes management data with variables form in managed system. The system is organized in a management information base (MIB) which describes the system status and configuration. These variables can be remotely queried by managing applications.

Configuring SNMP in networking, NMS, and a management program of SNMP should be set up at the Manager.

Configuration steps are listed as below for achieving query from NMS:

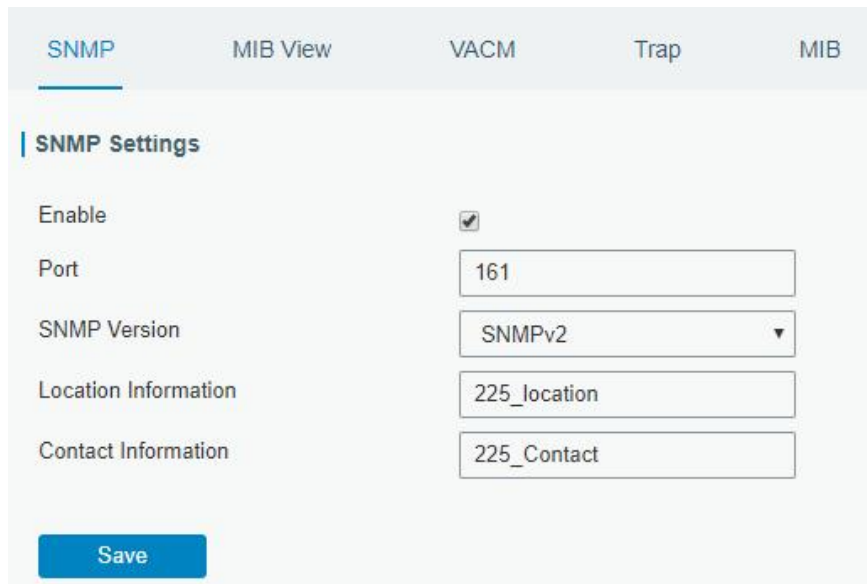

1. Enable SNMP setting.
2. Download MIB file and load it into NMS.
3. Configure MIB View.
4. Configure VCAM.

#### Related Configuration Example

[SNMP Application Example](#)

#### 3.4.7.1 SNMP

UR32 supports SNMPv1, SNMPv2c and SNMPv3 version. SNMPv1 and SNMPv2c employ community name authentication. SNMPv3 employs authentication encryption by username and password.

The image shows the 'SNMP Settings' configuration page. At the top, there are tabs for 'SNMP', 'MIB View', 'VACM', 'Trap', and 'MIB'. The 'SNMP' tab is selected. Below the tabs, the 'SNMP Settings' section contains the following fields:

- Enable:** A checkbox that is checked.
- Port:** A text input field containing the value '161'.
- SNMP Version:** A dropdown menu showing 'SNMPv2'.
- Location Information:** A text input field containing the value '225\_location'.
- Contact Information:** A text input field containing the value '225\_Contact'.

At the bottom of the settings section is a blue 'Save' button.

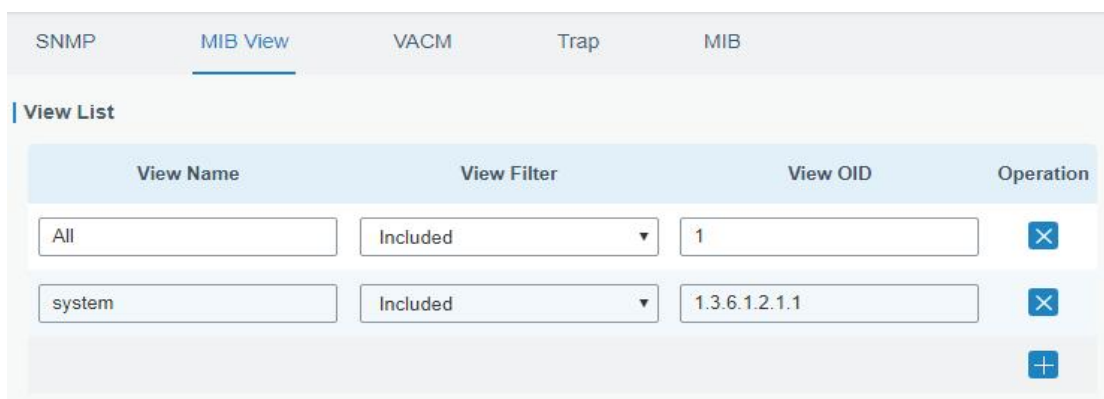

Figure 3-4-7-1

SNMP Settings	
Item	Description
Enable	Enable or disable SNMP function.
Port	Set SNMP listened port. Range: 1-65535. The default port is 161.
SNMP Version	Select SNMP version; support SNMP v1/v2c/v3.
Location Information	Fill in the location information.
Contact Information	Fill in the contact information.

Table 3-4-7-1 SNMP Parameters

### 3.4.7.2 MIB View

This section explains how to configure MIB view for the objects.

The image shows the 'MIB View' configuration page. At the top, there are tabs for 'SNMP', 'MIB View', 'VACM', 'Trap', and 'MIB'. The 'MIB View' tab is selected. Below the tabs, the 'View List' section contains a table with the following columns: 'View Name', 'View Filter', 'View OID', and 'Operation'.

View Name	View Filter	View OID	Operation
All	Included	1	✕
system	Included	1.3.6.1.2.1.1	✕
			+

Figure 3-4-7-2

MIB View	
Item	Description
View Name	Set MIB view's name.
View Filter	Select from "Included" and "Excluded".

View OID	Enter the OID number.
Included	You can query all nodes within the specified MIB node.
Excluded	You can query all nodes except for the specified MIB node.

Table 3-4-7-2 MIB View Parameters

### 3.4.7.3 VACM

This section describes how to configure VACM parameters.

The screenshot shows the VACM configuration page with tabs for SNMP, MIB View, VACM (selected), Trap, and MIB. Below the tabs is the 'SNMP v1 & v2 User List' section. It contains a table with the following columns: Community, Permission, MIB View, Network, and Operation. There are two rows of configuration: one for 'private' and one for 'public'. Both rows have 'Read-Write' selected for Permission, 'All' for MIB View, and '0.0.0.0/0' for Network. Each row has a blue 'X' icon in the Operation column, and a blue '+' icon is at the bottom right of the table.

Community	Permission	MIB View	Network	Operation
private	Read-Write	All	0.0.0.0/0	X
public	Read-Write	All	0.0.0.0/0	X

Figure 3-4-7-3

VACM	
Item	Description
<b>SNMP v1 &amp; v2 User List</b>	
Community	Set the community name.
Permission	Select from "Read-Only" and "Read-Write".
MIB View	Select an MIB view to set permissions from the MIB view list.
Network	The IP address and bits of the external network accessing the MIB view.
Read-Write	The permission of the specified MIB node is read and write.
Read-Only	The permission of the specified MIB node is read only.
<b>SNMP v3 User Group</b>	
Group Name	Set the name of SNMPv3 group.
Security Level	Select from "NoAuth/NoPriv", "Auth/NoPriv", and "Auth/Priv".
Read-Only View	Select an MIB view to set permission as "Read-only" from the MIB view list.
Read-Write View	Select an MIB view to set permission as "Read-write" from the MIB view list.
Inform View	Select an MIB view to set permission as "Inform" from the MIB view list.
<b>SNMP v3 User List</b>	
Username	Set the name of SNMPv3 user.
Group Name	Select a user group to be configured from the user group.
Authentication	Select from "MD5", "SHA", and "None".
Authentication Password	The password should be filled in if authentication is "MD5" and "SHA".
Encryption	Select from "AES", "DES", and "None".
Encryption Password	The password should be filled in if encryption is "AES" and "DES".

Table 3-4-7-3 VACM Parameters

### 3.4.7.4 Trap

This section explains how to enable network monitoring by SNMP trap.

Figure 3-4-7-4

SNMP Trap	
Item	Description
Enable	Enable or disable SNMP Trap function.
SNMP Version	Select SNMP version; support SNMP v1/v2c/v3.
Server Address	Fill in NMS's IP address or domain name.
Port	Fill in UDP port. Port range is 1-65535. The default port is 162.
Name	Fill in the group name when using SNMP v1/v2c; fill in the username when using SNMP v3.
Auth/Priv Mode	Select from "NoAuth & No Priv", "Auth & NoPriv", and "Auth & Priv".

Table 3-4-7-4 Trap Parameters

### 3.4.7.5 MIB

This section describes how to download MIB files. The last MIB file "LTE-ROUTER-MIB.txt" is for the UR32 router.

Figure 3-4-7-5

MIB	
Item	Description

MIB File	Select the MIB file you need.
Download	Click "Download" button to download the MIB file to PC.

Table 3-4-7-5 MIB Download

### 3.4.8 TR069

Technical Report 069 (TR-069) is a technical specification of Broadband Forum that defines an application layer protocol for remote management and provisioning of customer-premises equipment (CPE) connected to an Internet Protocol (IP) network.

Figure 3-4-8-1

TR-069	
Item	Description
Enable	Enable or disable TR069 feature.
Last Inform	The last time the router informed to TR069 ACS.
ACS Setting	
URL	The URL of TR069 auto configuration server (ACS).
ACS Username	The username used by ACS to authenticate the CPE when it initiates a connection request.
ACS Password	The password used by ACS to authenticate the CPE when it initiates a connection request.
CPE Setting	

Enable Period Inform	Enable or disable inform periodically.
Period Inform Interval (s)	The interval to report information to ACS, this should be less than the timeout of peer ACS.
CPE Username	The username used by CPE to authenticate the ACS when it initiates a connection request.
CPE Password	The password used by CPE to authenticate the ACS when it initiates a connection request.

Table 3-4-8-1 TR069 Parameters

### 3.5 Maintenance

This section describes system maintenance tools and management.

#### 3.5.1 Tools

Troubleshooting tools includes ping, traceroute, packet analyzer and qxdmlog.

##### 3.5.1.1 Ping

Ping tool is engineered to ping outer network.

Figure 3-5-1-1

PING	
Item	Description
Host	Ping outer network from the router.

Table 3-5-1-1 IP Ping Parameters

##### 3.5.1.2 Traceroute

Traceroute tool is used for troubleshooting network routing failures.

Figure 3-5-1-2

Traceroute	
Item	Description
Host	Address of the destination host to be detected.

Table 3-5-1-2 Traceroute Parameters

### 3.5.1.3 Packet Analyzer

Packet Analyzer is used for capturing the packet of different interfaces.

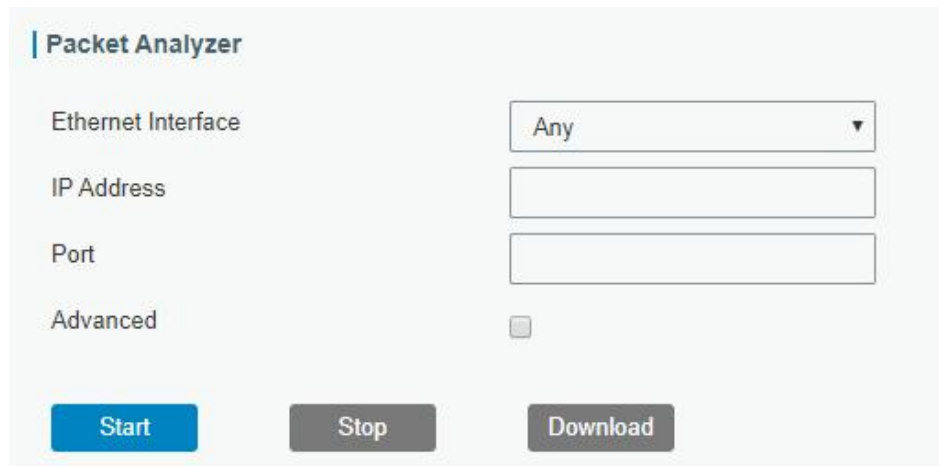

Figure 3-5-1-3

Packet Analyzer	
Item	Description
Ethernet Interface	Select the interface to capture packages.
IP Address	Set the IP address that the router will capture.
Port	Set the port that the router will capture.
Advanced	Set the rules for sniffer. The format is tcpdump.

Table 3-5-1-3 Packet Analyzer Parameters

### 3.5.1.4 Qxdmlog

This section allow collecting diagnostic logs via QXDM tool.

Figure 3-5-1-4

## 3.5.2 Debugger

### 3.5.2.1 Cellular Debugger

This section explains how to send AT commands to router and check cellular debug information.

Table 3-5-2-1 Cellular Debugger Parameters

### 3.5.2.2 Firewall Debugger

This section explains how to send commands to router and check firewall information.

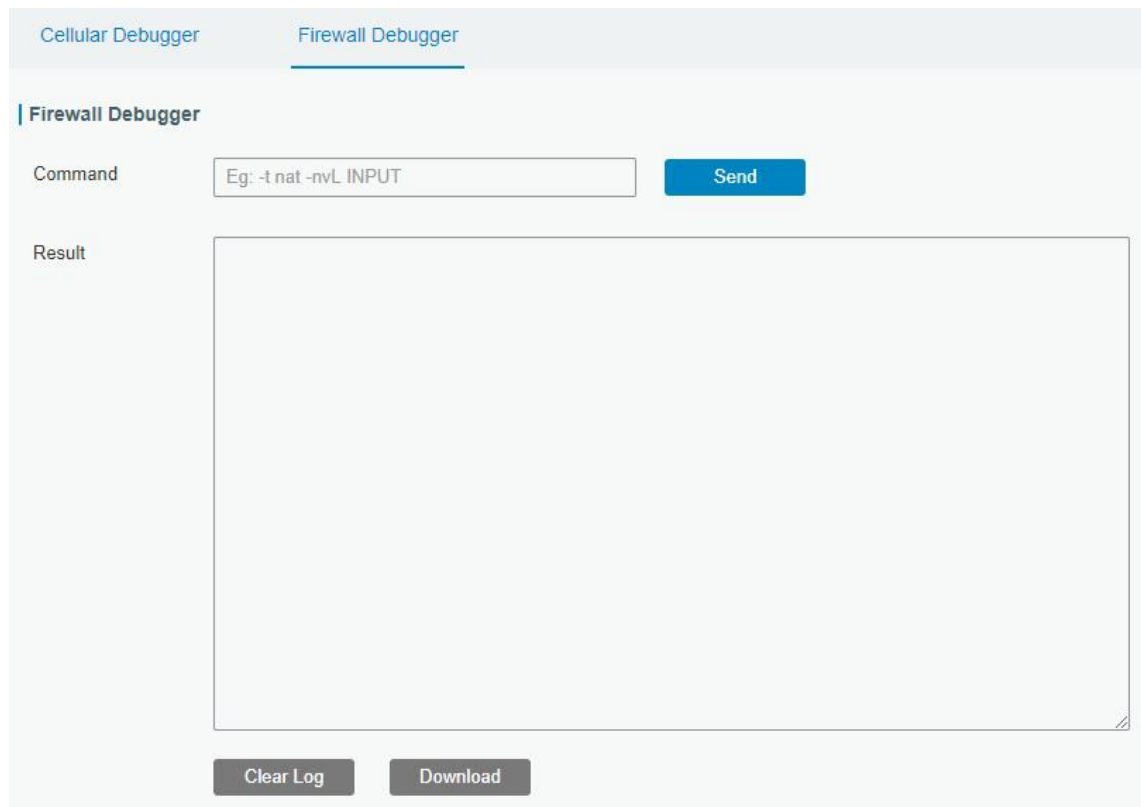

Figure 3-5-2-2

Firewall Debugger	
Item	Description
Command	Enter the AT command that you want to send to firewall module.
Result	Show the response result from firewall module.

Table 3-5-2-2 Firewall Debugger Parameters

### 3.5.3 Log

The system log contains a record of informational, error and warning events that indicates how the system processes. By reviewing the data contained in the log, an administrator or user troubleshooting the system can identify the cause of a problem or whether the system processes are loading successfully. Remote log server is feasible, and router will upload all system logs to remote log server such as Syslog Watcher.

#### 3.5.3.1 System Log

This section describes how to view the recent log on web.

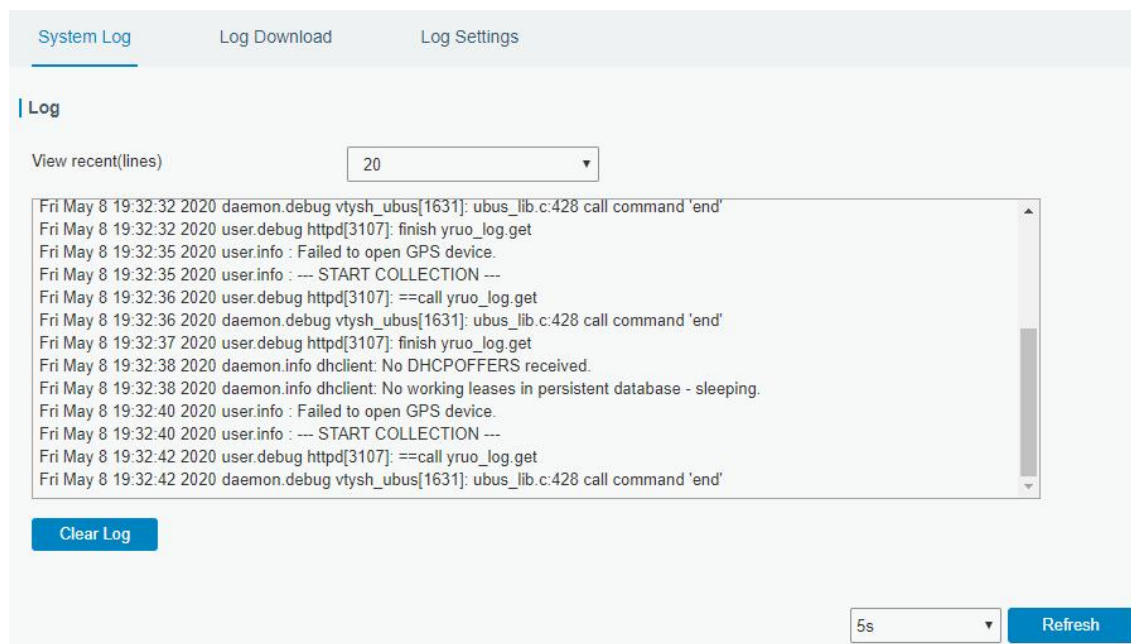

Figure 3-5-3-1

System Log	
Item	Description
View recent (lines)	View the specified lines of system log.
Clear Log	Clear the current system log.

Table 3-5-3-1 System Log Parameter

### 3.5.3.2 Log Download

This section describes how to download log files.

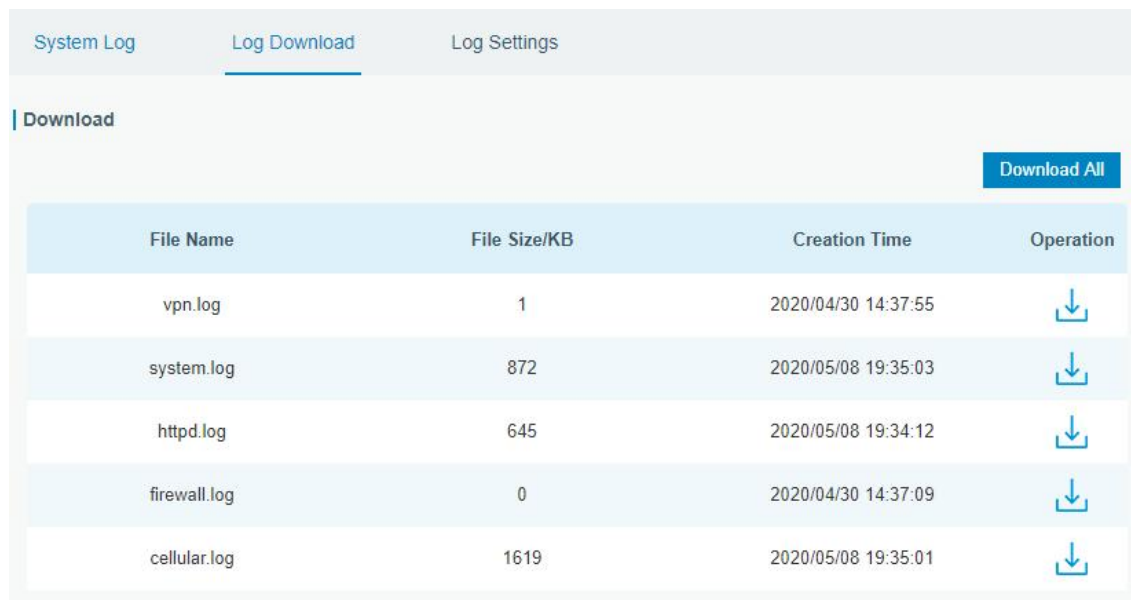

Figure 3-5-3-2

Log Download	
Item	Description
Download All	Download all log files.

File Name	Show the name of log files.
File Size/KB	Show the size of log files.
Creation Time	Show the creation time of log files.
Operation	Click to download every log file.

Table 3-5-3-2 System Log Parameter

### 3.5.3.3 Log Settings

This section explains how to enable remote log server and local log setting.

Figure 3-5-3-3

Log Settings	
Item	Description
<b>Remote Log Server</b>	
Enable	With “Remote Log Server” enabled, router will send all system logs to the remote server.
Syslog Server Address	Fill in the remote system log server address (IP/domain name).
Port	Fill in the remote system log server port.
<b>Local Log File</b>	
Storage	User can store the log file in memory or TF card.
Size	Set the size of the log file to be stored.
Log Severity	The list of severities follows the syslog protocol.

Table 3-5-3-3 Log Settings Parameters

### 3.5.4 Upgrade

This section describes how to upgrade the router firmware via web. Generally you don't need to do the firmware upgrade.

**Note:** any operation on web page is not allowed during firmware upgrade, otherwise the upgrade will be interrupted, or even the device will break down.

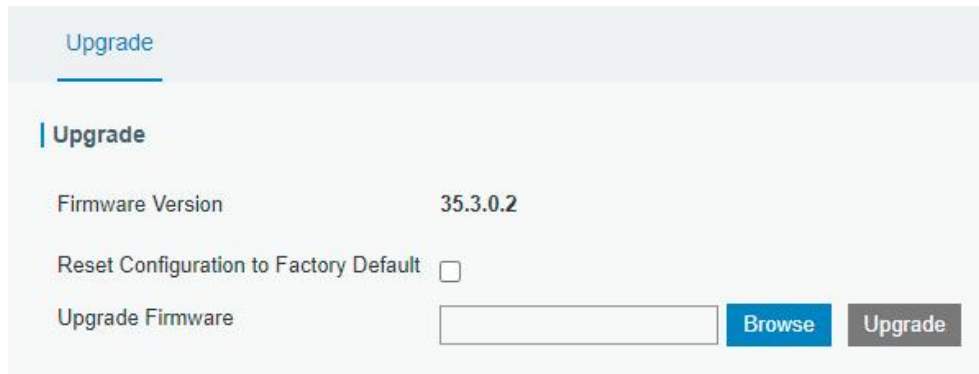

Figure 3-5-4-1

Upgrade	
Item	Description
Firmware Version	Show the current firmware version.
Reset Configuration to Factory Default	When this option is checked, the router will be reset to factory defaults after upgrade.
Upgrade Firmware	Click "Browse" button to select the new firmware file, and click "Upgrade" to upgrade firmware.

Table 3-5-4-1 Upgrade Parameters

### Related Configuration Example

[Firmware Upgrade](#)

### 3.5.5 Backup and Restore

This section explains how to create a complete backup of the system configurations to a file, restore the config file to the router and reset to factory defaults.

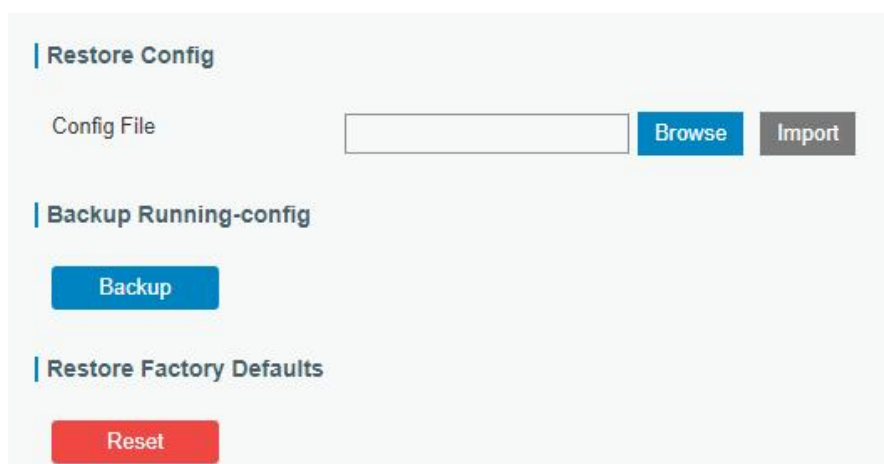

Figure 3-5-5-1

Backup and Restore	
Item	Description
Config File	Click "Browse" button to select configuration file, and then click "Import" button to upload the configuration file to the router.
Backup	Click "Backup" to export the current configuration file to the PC.
Reset	Click "Reset" button to reset factory default settings. Router will restart after reset process is done.

Table 3-5-5-1 Backup and Restore Parameters

## Related Configuration Example

### [Restore Factory Defaults](#)

#### 3.5.6 Reboot

On this page you can reboot the router immediately or regularly. We strongly recommend clicking "Save" and "Apply" button before rebooting the router so as to avoid losing the new configuration.

The screenshot shows the 'Reboot' configuration interface. It includes a 'Reboot Device' section with a 'Reboot Now' button and a 'Schedule' section. The 'Schedule' section has an 'Enable' checkbox checked, a 'Cycles' dropdown menu set to 'Every Day', and two time input boxes both set to '0'. A 'Save' button is located at the bottom left of the 'Schedule' section.

Figure 3-5-6-1

Reboot	
Item	Description
Reboot Now	Reboot the router immediately.
Schedule	
Enable	Reboot the router at a scheduled frequency.
Cycles	Select the date and time to execute the schedule.

Table 3-5-2-1 Schedule Parameters

## 3.6 APP

### 3.6.1 Python

Python is an object-oriented programming language that has gained popularity because of its clear syntax and readability.

As an interpreted language, Python has a design philosophy that emphasizes code readability, notably using whitespace indentation to delimit code blocks rather than curly brackets or keywords, and a syntax that allows programmers to express concepts in fewer lines of code than it's used in other languages such as C++ or Java. The language provides constructs and intends to enable writing clear programs on both small and large scale.

Users can use Python to quickly generate the prototype of the program, which can be the final interface of the program, rewrite it with a more appropriate language, and then encapsulate the extended class library that Python can call.

This section describes how to view the relevant running status such as App-manager, SDK version, extended storage, etc. Also you can change the App-manager configuration, and import the Python App package from here.

#### 3.6.1.1 Python

Micro SD card must be installed for Python App.

## Chapter 4 Application Examples

### 4.1 Network Connection

#### 4.1.1 Cellular Connection

The UR32 routers have two cellular interfaces, named SIM1 & SIM2. Only one cellular interface is active at one time. We are about to take an example of inserting a SIM card into SIM1 slot of the UR32 and configuring the router to get Internet access through cellular.

#### Configuration Steps

1. Ensure the SIM card is inserted well before powering on and all cellular antennas are connected to the correct connectors.
2. Go to **Network > Interface > Cellular > Cellular Setting** to configure the cellular info, then click **Save** and **Apply**.

The screenshot shows the 'Cellular Settings' page. The left sidebar has a menu with 'Status', 'Network', 'Interface', 'DHCP', 'Firewall', 'QoS', 'VPN', 'IP Passthrough', 'Routing', and 'VRRP'. The 'Cellular' tab is selected under the 'Interface' section. The main area is titled 'Cellular Settings' and contains two columns for 'SIM1' and 'SIM2'. Each column has fields for Protocol Type (IPv4), APN, Username, Password, PIN Code (masked with \*\*\*\*), Access Number, Authentication Type (None), Network Type, and PPP Preferred (checkbox).

3. Go to **Network > Interface > Link Failover** to enable correspond SIM and drag buttons to change link priority.

The screenshot shows the 'Link Priority' page. The left sidebar is the same as the previous screenshot. The 'Link Failover' tab is selected under the 'Interface' section. The main area is titled 'Link Priority' and contains a table with the following data:

Priority	Enable Rule	Link in use	Interface	Connection Type	IP	Operation
1	<input checked="" type="checkbox"/>	●	Cellular-SIM1	-	-	
2	<input checked="" type="checkbox"/>	●	Cellular-SIM2	DHCP	-	
3	<input checked="" type="checkbox"/>	●	WAN	Static IP	192.168.22.225	

4. Click to configure ICMP ping detection information. When ping probe is enabled, the router will send ICMP packets to detection server to check if this link is valid. If no response and exceeding max retries, it will switch to the lower priority link.

**Note:** if you use private SIM card, please change a private server address or disable the ping probe.

**Ping Detection**

Enable ☒

IPv4 Primary Server

IPv4 Secondary Server

IPv6 Primary Server

IPv6 Secondary Server

Interval  s

Retry Interval  s

### 4.1.2 Ethernet WAN Connection

UR32 supports to get Internet access via WAN port.

#### Configuration Steps

1. Go to **Network > Interface > WAN** to select connection type and configure WAN parameters, then save all settings. The following examples of static IP type, DHCP Client type, and PPPoE type are listed for your reference.

The screenshot shows the 'WAN' configuration page for 'WAN\_1'. The left sidebar contains a menu with 'Interface' selected. The main content area has tabs for 'Link Failover', 'Cellular', 'Port', 'WAN', 'Bridge', and 'Switch'. The 'WAN' tab is active, and a blue box highlights the configuration fields for 'WAN\_1'.

Field	Value
Enable	<input checked="" type="checkbox"/>
Port	LAN1/WAN
Connection Type	Static IP
IPv4 Address	192.168.22.225
Netmask	255.255.255.0
IPv4 Gateway	192.168.22.1
IPv6 Address	fe80::26e1:24ff:fe0:3192
Prefix-length	64
IPv6 Gateway	
MTU	1500
Primary DNS	8.8.8.8
Secondary DNS	
Enable NAT	<input checked="" type="checkbox"/>

2. Go to **Network > Interface > Link Failover** to enable WAN and drag buttons to change link priority.

The screenshot shows the 'Link Priority' configuration page. The 'Link Failover' tab is active. The table below lists the configured links with their priorities and enablement status.

Priority	Enable Rule	Link in use	Interface	Connection Type	IP	Operation
1	<input checked="" type="checkbox"/>	<span style="color: green;">●</span>	WAN	Static IP	192.168.22.225	<a href="#">✎</a> <a href="#">↑</a> <a href="#">↓</a>

## 4.2 Wi-Fi Application Example (Only Applicable to Wi-Fi Version)

### 4.2.1 AP Mode

UR32 supports to work as access point (AP) to provide network access to other devices.

## Configuration Steps

- Go to **Network > Interface > WLAN** to select work mode as AP and define the wireless parameters as required, then save all settings.

Link Failover	Cellular	Port	WAN	Bridge	WLAN
<b>WLAN</b>					
Enable	<input checked="" type="checkbox"/>				
Work Mode	AP				
BSSID	24:e1:24:f0:2f:eb				
Radio Type	802.11n(2.4GHz)				
Channel	Auto				
Bandwidth	20MHz				
SSID	Router_F02FEB				
Encryption Mode	WPA-PSK/WPA2-PSK				
Cipher	Auto				
Key	*****				
SSID Broadcast	<input checked="" type="checkbox"/>				
AP Isolation	<input type="checkbox"/>				
Guest Mode	<input type="checkbox"/>				
Max Client Number	10				

- Use a smart phone to connect the access point of UR32. Go to **Status > WLAN**, and you can check the AP settings and information of the connected client/user.

<b>WLAN Status</b>					
Name	Status	Type	SSID	IP Address	Netmask
WLAN	Running	AP	Router_F02FEB	192.168.1.1	255.255.255.0
<b>Associated Stations</b>					
SSID	MAC Address	IP Address	Connection Duration		
Router_F02FEB	3c:cd:5d:47:10:8e	192.168.1.191	18 seconds		

### 4.2.2 Client Mode

UR32 supports to work as Wi-Fi client to connect to an access point to get Internet access.

## Configuration Steps

- Go to **Network > Interface > WLAN**, click **Scan** to search for access points and click **Join Network**,

then save the settings. For some access points, it is necessary to fill in the Wi-Fi password.

Link Failover	Cellular	Port	WAN	Bridge	WLAN
<b>WLAN</b>					
Enable	<input checked="" type="checkbox"/>				
Work Mode	Client				Scan
SSID	WIFI TEST				
BSSID	3c:cd:5d:47:10:8e				
Encryption Mode	WPA2-PSK				
Cipher	AES				
Key	*****				
IP Setting					
Protocol	DHCP Client				

- Go to **Status > WLAN**, and you can check the connection status of the client.

## 4.3 OpenVPN Client Application Example

UR32 routers can work as OpenVPN clients or OpenVPN servers. We are about to take an example of configuring an OpenVPN client to connect to OpenVPN CloudConnexa.

## Configuration Steps

1. Ensure the UR32 has gotten access to the Internet.
2. Log in to the CloudConnexa account, select the Network section and select the service depending on your requirement and follow the wizard to continue the settings.

### Select Network Scenarios

Please select all applicable scenarios for the network you are going to create.

**Remote Access** ⓘ  
Connect your private resources to CloudConnexa. Provide remote access to your resources, which are hosted on IaaS Cloud, and on premises resources.  
[Read more](#) ↗

**Site-to-site** ⓘ  
Connect multiple private networks to CloudConnexa (site-to-site connectivity). This wizard will assist you in adding a single network. You can use this wizard to connect all of your networks.  
[Read more](#) ↗

**Secure Internet Access** ⓘ  
Provide secure access to public resources. Use this network as an Internet Gateway for all internet traffic or only for selected public resources. You can then apply whitelisting rules to your public resources.  
[Read more](#) ↗

If you would like to connect a single server you can create a [host](#) ↗ and connect your server directly to CloudConnexa

Skip Wizard

Continue

3. Select the provider type as OpenWrt and download the OVPN file.

### Deploy Network Connector (connector01)

#### Connector Details

Name

connector01

Region

Singapore

Each Connector must be installed and connected to CloudConnexa. Select where you would like to deploy Network Connector.

OpenVPN Compatible Router : OpenWrt

#### 1 Download .ovpn Profile

Download OVPN Profile

#### 2 Use .ovpn Profile

Use .ovpn Profile on your router and connect it to CloudConnexa

[Read how to use .ovpn Profile and connect OpenWrt router to CloudConnexa](#) ↗

4. If you need to access the terminal devices under subnet, it's necessary to add the route and IP service as LAN subnet of the router.

**Network Configuration**  
Selected Scenarios: Remote Access

**Add route**  
Routes define public and private subnets that will be routed to this Network. Routes are pushed to the routing table of User Devices and Connectors, so that they can access IP Services.

No Route defined yet.

[Add Route](#)

**Add IP Service**  
IP Services are defined as access to specific IP address ranges and protocols.

No IP Service defined yet.

[Add IP Service](#)

- Define Network
- Deploy Network Connector  
connector01 ✓
- Add Application
- 4 Add Routes and IP Services**
- 5 Configure Access Group (Optional)

5. Go to **Network > VPN > OpenVPN Client**, select configuration method as File Configuration, then import the OVPN file.

**OpenVPN Client Settings**

OpenVPN Client\_1

Enable ☒

## 4.4 NAT Application Example

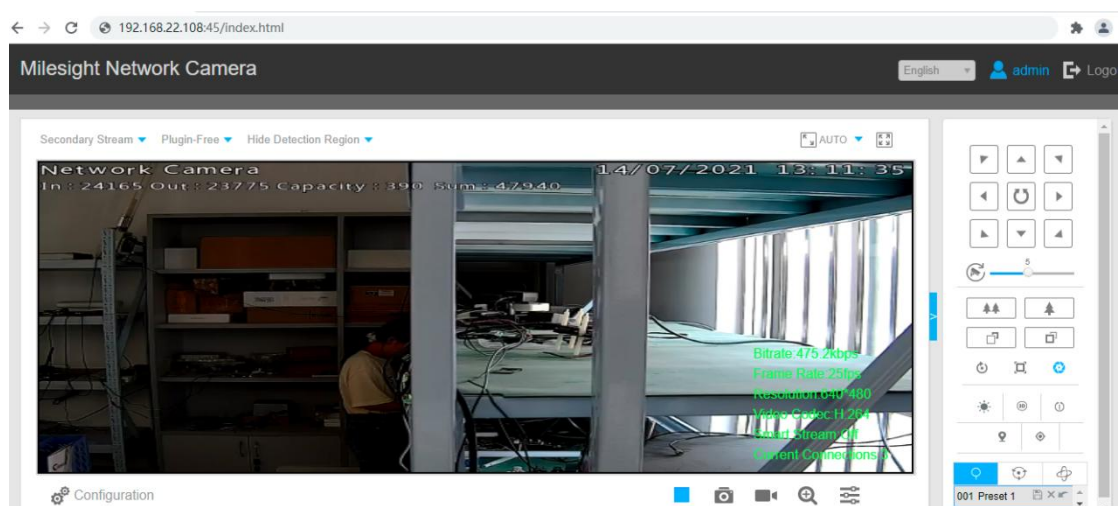

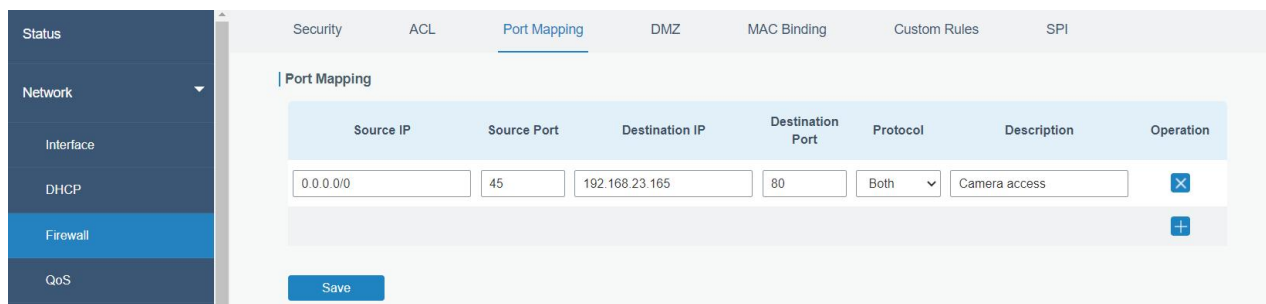

### Example

An UR32 router can access to the Internet via cellular and get a public IP address. LAN port is connected with an IP camera whose IP address is 192.168.23.165 and HTTP port is 80. This IP camera can be accessed by public IP address via the below port mapping settings.

### Configuration Steps

Go to **Firewall > Port Mapping** and configure port mapping parameters as below. Source IP address 0.0.0.0/0 means all external addresses are allowed to access. After that, users can use public IP: external port to access the IP camera.

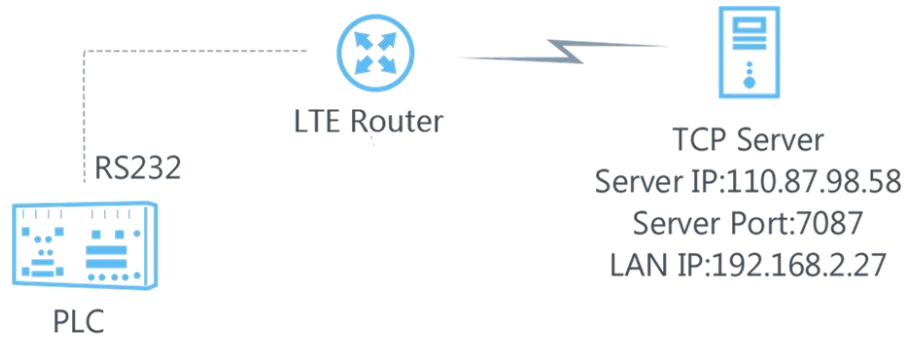

### Related Topic

[Port Mapping](#)

## 4.5 DTU Application Example

### Example

A PLC is connected with the UR32 via RS232 and need to forward the data to a remote TCP server transparently.

### Configuration Steps

1. Go to **Service > Serial Port > Serial1**, enable Serial 1 and configure serial port parameters. The serial port parameter shall be kept in consistency with those of PLC, as shown in figure below.

The screenshot shows the 'Serial' configuration page in a web interface. The 'Serial Settings' section is active. The 'Enable' checkbox is checked. The 'Serial Type' is set to 'RS232'. The 'Baud Rate' is set to '9600'. The 'Data Bits' are set to '8bits'. The 'Stop Bits' are set to '1bits'. The 'Parity' is set to 'None'. The 'Software Flow Control' checkbox is unchecked.

Parameter	Value
Enable	<input checked="" type="checkbox"/>
Serial Type	RS232
Baud Rate	9600
Data Bits	8bits
Stop Bits	1bits
Parity	None
Software Flow Control	<input type="checkbox"/>

2. Configure Serial Mode as DTU Mode, DTU protocol as Transparent and protocol as TCP.

Serial Mode	DTU Mode	▼
DTU Protocol	Transparent	▼
Protocol	TCP	▼
Keepalive Interval	75	s
Keepalive Retry Times	9	
Packet Size	1024	Bytes
Serial Frame Interval	100	ms
Reconnect Interval	10	s
Specific Protocol	<input type="checkbox"/>	
Register String		

### 3. Configure TCP server IP and port.

Destination IP Address

Server Address	Server Port	Status	Operation
110.87.98.58	7087		<input type="button" value="✕"/>
			<input type="button" value="✚"/>

### 4. Start TCP server on PC. Take **Netassist** test software as example. Make sure port mapping is already done.

Settings

(1) Protocol  
TCP Server

(2) Local host IP  
192.168.2.27

(3) Local host port  
7087

### 5. Connect the UR32 to PC via RS232 for PLC simulation. Then start **sscom** software on the PC to test communication through serial port.

ComNum COM9

BaudRate 9600

DataBits 8

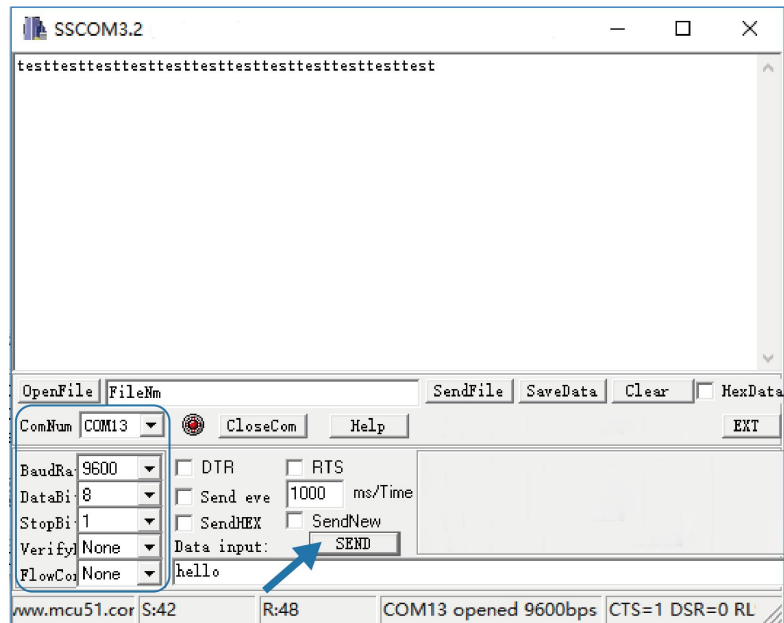

StopBits 1

Verify None

FlowControl None

- After connection is established between the UR32 and the TCP server, you can send data between sscocom and Netassist.

#### PC side

#### TCP server side

- After serial communication test is done, you can connect PLC to RS232 port of the UR32 for test.

## 4.6 Restore Factory Defaults

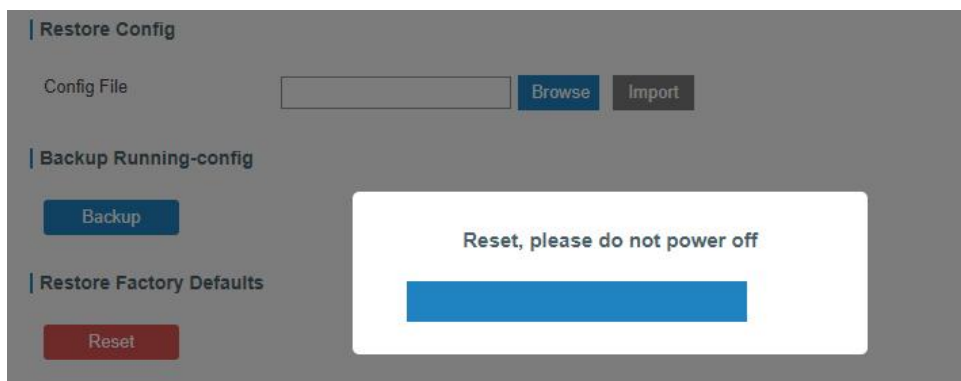

### Method 1:

Log in web interface, and go to **Maintenance > Backup and Restore**, click **Reset** button.

You will be asked to confirm if you'd like to reset it to factory defaults. Then click **Reset** button.

Then the router will reboot and restore to factory settings immediately.

Please wait till the SYSTEM LED blinks slowly and login page pops up again, which means the router has already been reset to factory defaults successfully.

## Related Topic

[Restore Factory Defaults](#)

### Method 2:

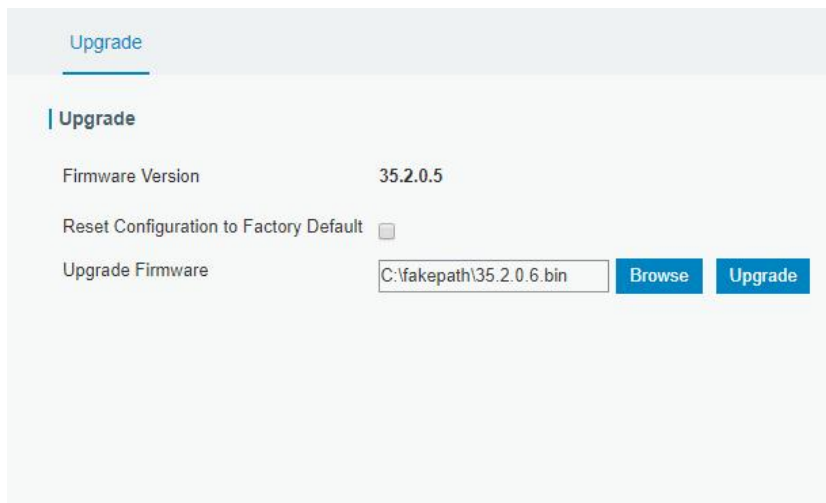

Locate the reset button on the router, press and hold the reset button for more than 5s until the LED blinks.

## 4.7 Firmware Upgrade

It is suggested that you contact Milesight technical support first before you upgrade router firmware. After getting firmware file please refer to the following steps to complete the upgrade.

1. Go to **Maintenance > Upgrade**, click **Browse** and select the correct firmware file from the PC.
2. Click **Upgrade** and the router will check if the firmware file is correct. If it's correct, the firmware will be imported to the router, and then the router will start to upgrade.

**Note: It is recommended to check the box of Reset Configuration to Factory Default before upgrade.**

## Related Topic

[Upgrade](#)

## 4.8 SNMP Application Example

Before you configure SNMP parameters, please download the relevant MIB file from the UR32's WEB GUI first, and then upload it to any software or tool which supports standard SNMP protocol. Here we take ManageEngine MibBrowser Free Tool as an example to access the router to query cellular information.

1. Go to **Service > SNMP > MIB** and download the MIB file **LTE-ROUTER-MIB.txt** to PC.

2. Start ManageEngine MibBrowser Free Tool on the PC. Click **File > Load MIB** on the menu bar. Then select **LTE-ROUTER-MIB.txt** file from PC and upload it to the software.

Click the “+” button beside LTE-ROUTER-MIB, which is under the **Loaded MibModules** menu, and find **usCellularinfo**. And then you will see the OID of cellular info is “.1.3.6.1.4.1.50234”, which will be filled in the MIB View settings.

- Go to **Service > SNMP > SNMP** to enable SNMP feature.

SNMP
MIB View
VACM
Trap
MIB

### SNMP Settings

Enable
☒

Port

SNMP Version

Location Information

Contact Information

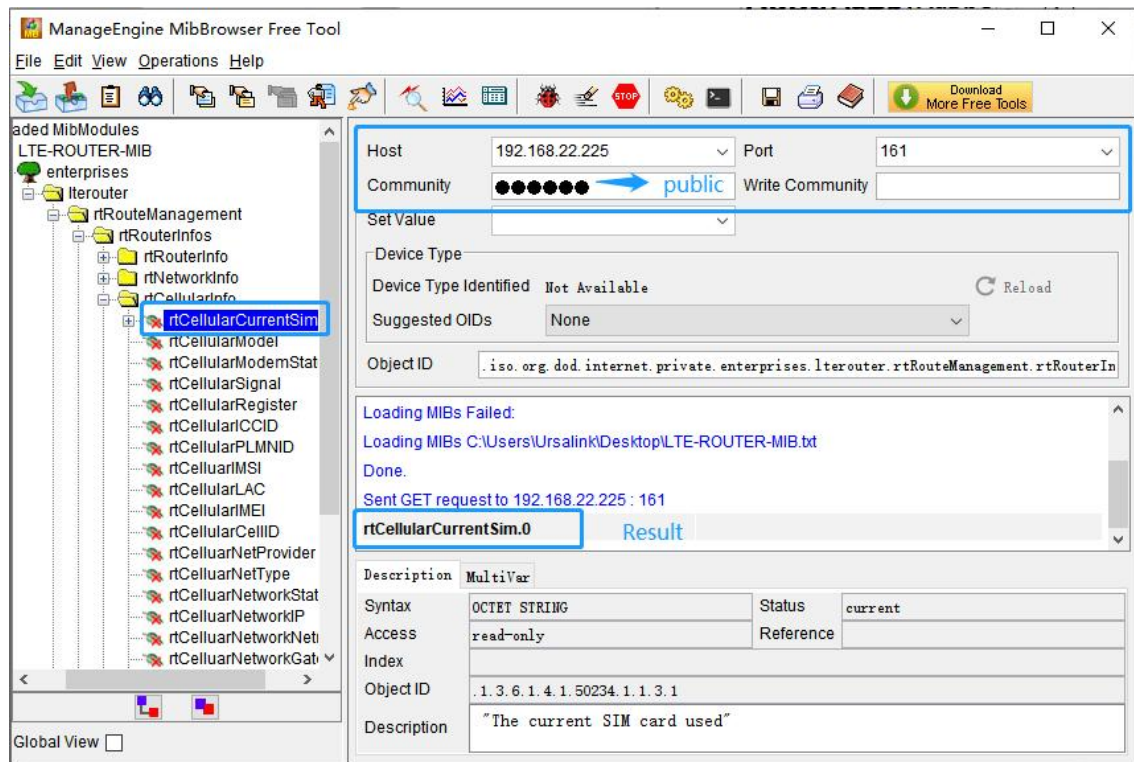

- Click  to add a new MIB view and define the view to be accessed from the outside network. Then click "Save" button.

The screenshot shows the 'MIB View' configuration page. At the top, there are tabs for 'SNMP', 'MIB View' (which is selected), 'VACM', 'Trap', and 'MIB'. Below the tabs, there is a section titled 'View List'. It contains a table with the following columns: 'View Name', 'View Filter', 'View OID', and 'Operation'. The first row of the table has the following values: 'cellular' in the 'View Name' column, 'Included' in the 'View Filter' column, '1.3.6.1.4.1.50234.1.3' in the 'View OID' column, and a blue 'X' icon in the 'Operation' column. Below the table, there is a blue button labeled 'Save'.

5. Click  to add a new VACM setting to define the access authority for the specified view from the specified outside network, then save all settings.

The screenshot shows the 'VACM' configuration page. At the top, there are tabs for 'SNMP', 'MIB View', 'VACM' (which is selected), 'Trap', and 'MIB'. Below the tabs, there is a section titled 'SNMP v1 & v2 User List'. It contains a table with the following columns: 'Community', 'Permission', 'MIB View', 'Network', and 'Operation'. The first row of the table has the following values: 'public' in the 'Community' column, 'Read-Write' in the 'Permission' column, 'cellular' in the 'MIB View' column, '0.0.0.0/0' in the 'Network' column, and a blue 'X' icon in the 'Operation' column. Below the table, there is a blue button labeled 'Save'.

6. Go to MibBrowser, enter host IP address, port and community. Right click **usCellular CurrentSim** and then click **FET**. Then you will get the current SIM info on the result box. You can get other cellular info in the same way.

## 4.9 VRRP Application Example

### Application Example

A Web server requires Internet access through the UR32 router. To avoid data loss caused by router breakdown, two UR32 routers can be deployed as VRRP backup group, so as to improve network reliability.

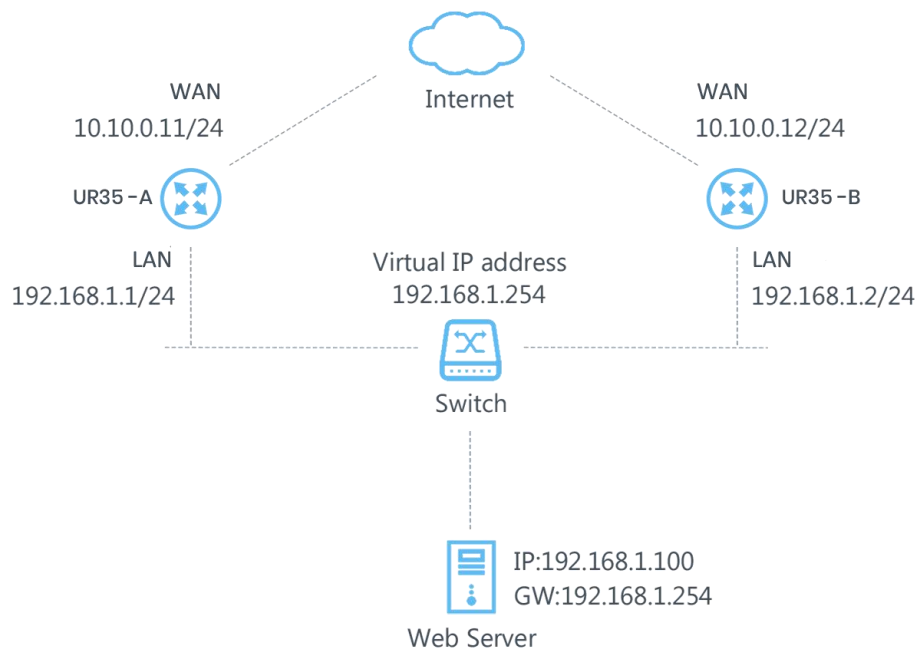

VRRP group:

WAN ports of the UR32 Router A and Router B are connected to the Internet via wired network. And LAN ports of them are connected to a switch.

Virtual IP is 192.168.1.254/24.

Router	Virtual Router ID (Same for A and B)	Port connected with switch	LAN IP Address	Priority	Preemption Mode
A	1	LAN2	192.168.1.1	110	Enable
B	1	LAN2	192.168.1.2	100	Disable

Refer to the topological below.

## Configuration Steps

### Router A Configuration

- Go to **Network > Interface > WAN** and configure wired WAN connection as below.

Link Failover	Cellular	Port	WAN	Bridge
<b>WAN Settings</b>				
<b>WAN_1</b>				
Enable	<input checked="" type="checkbox"/>			
Port	LAN1/WAN			
Connection Type	Static IP			
IPv4 Address	10.10.0.11			
Netmask	255.255.255.0			
IPv4 Gateway	10.10.0.1			
IPv6 Address	fe80::26e1:24ff:fe0:3192			
Prefix-length	64			
IPv6 Gateway				
MTU	1500			
Primary DNS	8.8.8.8			
Secondary DNS				
Enable NAT	<input checked="" type="checkbox"/>			

- Go to **Network > VRRP > VRRP** and configure VRRP parameters as below.

**VRRP**

**VRRP Status**

Status: DISABLE

**VRRP Settings**

Enable: ☒

Interface: Bridge0

Virtual Router ID: 1

Virtual IP: 192.168.1.254

Priority: 110

Advertisement Interval (s): 1

Preemption Mode: ☐

IPv4 Primary Server: 8.8.8.8

IPv4 Secondary Server: 114.114.114.114

Interval: 300 s

Retry Interval: 5 s

Timeout: 3 s

Max Ping Retries: 3

## Router B Configuration

- Go to **Network > Interface > WAN** and configure wired WAN connection as below.

Link Follower Cellular Port **WAN** Bridge

**WAN Settings**

**WAN\_1**

Enable: ☒

Port: LAN1/WAN

Connection Type: Static IP

IPv4 Address: 10.10.0.12

Netmask: 255.255.255.0

IPv4 Gateway: 10.10.0.1

IPv6 Address: fe80::26e1:24ff:fe0:3192

Prefix-length: 64

IPv6 Gateway:

MTU: 1500

Primary DNS: 8.8.8.8

Secondary DNS:

Enable NAT: ☒

- Go to **Network > VRRP > VRRP** and configure VRRP parameters as below.

VRRP

**Status**
DISABLE

VRRP Settings

Enable

Interface

Virtual Router ID

Virtual IP

Priority

Advertisement Interval (s)

Preemption Mode

IPv4 Primary Server

IPv4 Secondary Server

Interval

Retry Interval

Timeout

Max Ping Retries

☒

Bridge0

192.168.1.254

100

1

☐

8.8.8.8

114.114.114.114

300

5

3

3

Once you complete all configurations, click **Apply** button on the top-right corner to make changes take effect.

**Result:** normally, A is the master router, used as the default gateway. When the power of Router A is down or Router A suffers from failure, Router B will become the master router, used as the default gateway. With Preemption Mode enabled, Router A will be master and Router B will demote back to be the backup once Router A can access the Internet again.

## 4.10 QoS Application Example

### Example

Configure the UR32 router to distribute local preference to different FTP download channels. The total download bandwidth is 75000 kbps.

**Note:** the “Total Download Bandwidth” should be less than the real maximum bandwidth of WAN or cellular interface.

FTP Server IP & Port	Percent	Max Bandwidth(kbps)	Min Bandwidth(kbps)
110.21.24.98:21	40%	30000	25000
110.32.91.44:21	60%	45000	40000

## Configuration Steps

1. Go to **Network > QoS > QoS(Download)** to enable QoS and set the total download bandwidth.

**Download Bandwidth**

Enable ☒

Default Category

Download Bandwidth  kbits/s

Capacity

2. Click “+” to set up service classes.

**Note: the percents must add up to 100%.**

**Service Category**

Name	Percent(%)	Max BW(kbps)	Min BW(kbps)	Operation
1	40	30000	25000	<input checked="" type="button" value="X"/>
2	60	45000	40000	<input checked="" type="button" value="X"/>
				<input type="button" value="+"/>

3. Click “+” to set up service category rules.

**Service Category Rules**

Name	Source IP	Source Port	Destination IP	Destination Port	Protocol	Service Category	Operation
ftp1	110.21.24.98	21			ANY	1	<input checked="" type="button" value="X"/>
ftp2	110.32.91.44	21			ANY	2	<input checked="" type="button" value="X"/>
							<input type="button" value="+"/>

**Note:**

**IP/Port: null refers to any IP address/port.**

Click **Save** and **Apply** button.
