MILESIGHT ADMCC COMPLIANCE

Declaration for project qualification and customer technical review

MILESIGHT ADMCC COMPLIANCE DECLARATION

To Whom It May Concern

Milesight issues this declaration to support local project admission, pre-qualification, and customer technical due diligence for surveillance projects in Abu Dhabi.

Reference and product scope

This declaration is based on the National Manual for Surveillance Systems Version 3.0 (2026) and the supplied MCC requirements-to-compliance matrix. It applies only to Milesight surveillance cameras and the applicable Milesight video analytics capabilities selected for a specific project. AI functions may be provided by camera-edge processing or by an associated backend solution, as identified in the approved project bill of materials.

Declaration

Subject to the conditions below, Milesight confirms that the evaluated product functions can be configured to address the applicable product-level provisions recorded in the supplied compliance matrix, including:

- Fixed IP camera architecture, 1920 x 1080 resolution or higher, IR illumination, dual streams, H.264 or newer codecs, WDR, and motorized varifocal capability where the application requires it.

- ONVIF Profile S interoperability, SNMPv3 support, secure protocol configuration, and commissioning with authenticated access, non-default credentials, least-privilege permissions, and unused services disabled where operationally feasible.

- Outdoor camera suitability for UAE conditions with a minimum IP66 ingress rating for the applicable outdoor models.

- Camera configuration capability for the applicable coverage level, including field of view, pixel density, frame rate, lighting, and installation-angle requirements, to be verified against the approved site design.

- Applicable video analytics capabilities, including real-time event notification and associated metadata, subject to the selected model, licence, deployment architecture, and project use case.

Project-specific conditions

Final compliance must be verified against the approved equipment list, the facility category and group, coverage drawings, site lighting and environmental conditions, required retention period, and the final VMS, recording, storage, network, power, and commissioning configuration. Requirements relating to monitoring rooms, storage, redundancy, cybersecurity operations, audit records, maintenance, signage, data

extraction, cloud or remote connectivity, and authority approvals are project and entity obligations or depend on associated third-party/system components.

Limitations

This declaration is not an authority approval, a product certification issued by ADMCC or any other concerned authority, or a waiver of project-specific requirements. Any connection to the public Internet, cloud service, remote maintenance service, or external system remains subject to the approvals and controls required by the applicable authority. Where ANPR or specialized analytics are proposed, the complete end-to-end solution, including platform functions and alert handling, must be separately verified during project design and acceptance.

Verification and support

Milesight will provide reasonable product documentation and configuration support for the selected project solution. The system integrator and project entity remain responsible for final design, installation, configuration, testing, documentation, and submission to the concerned authority.
